---	--

Calc. Description:

PURPOSE:

This calculation incorporates by attachment Scientech Engineering Calculation No. 17080-M-03, Rev. 0, prepared under Task Agreement 99A-C20, in accordance with CNS Engineering Procedure 3.4.7, Section 4. The calculation determines the doses to a Control Room operator and to a person at the Exclusion Area Boundary (EAB) and Low Population Zone (LPZ) following a postulated design basis Loss of Coolant Accident (LOCA). This calculation has been prepared as a Status 2 calculation for NRC review and will be as-built upon NRC approval.

RESULTS:

The results are tabulated in Section 11, Table 9 of Scientech's calculation for each of the three (3) receptor locations:

1. Control Room,
2. Low Population Zone (LPZ).
3. Exclusion Area Boundary (EAB), and

All calculated doses are less than the corresponding regulatory limits.

PURPOSE

This calculation incorporates by attachment Scientech Engineering Calculation No. 17080-M-03, Rev. 0, prepared under Task Agreement 99A-C20, in accordance with CNS Engineering Procedure 3.4.7, Section 4. The calculation determines the doses to a Control Room operator and to a person at the Exclusion Area Boundary (EAB) and Low Population Zone (LPZ) following a postulated design basis Loss of Coolant Accident (LOCA).

EXTENT OF REVIEW

Scientech's calculation was performed under their own QA program, which included an independent technical review. Therefore, the NPPD review does not include in-depth checks of mathematical calculations, but rather focuses on general acceptability of design inputs, assumptions, methodology, and conclusions. Any significant comments or concerns identified during the review have been resolved with Scientech and incorporated.

REVIEW SUMMARY

Scientech's calculation is organized into a single main portion and Attachments 1 through 5, which include the computer code input and output, and Library File changes.

- 1. Purpose - The purpose of the calculation is as given above and as stated in Section 1 of Scientech's calculation. This section was reviewed and found to be acceptable.
2. Design Inputs - Design Inputs are identified throughout the text and particularly in Table 3 of Section 4 of Scientech's calculation with the references for the design inputs listed in Section 5. Design inputs listed in this table include data for the source term, containment and Control Room volumes, release rates and filtration efficiencies, and atmospheric dispersion factors. The source term is based on initial power level and operating history and is therefore independent of fuel type. ICRP 30 Dose Conversion Factors (DCF's) used in the model are listed in Table 2 of Scientech's calculation. Atmospheric dispersion factors for the Control Room were taken from Reference 5.10 (NEDC 99-031) and from Reference 5.11 (NEDC 99-036) for the EAB and LPZ.

The design inputs were reviewed and found to be acceptable.

Documents comprising CNS-controlled source documents whose revision could impact input used in this calculation are identified on the Cross Reference Index in the front of this calculation. Non-status 1 inputs were verified using additional information and were found to be acceptable for use in this calculation.

 Rev. No: 0 Date: 12/3/99 Date: 12/9/99

3. **Assumptions** - Major assumptions are identified in Section 6 of Sciencetech's calculation. Additional assumptions are inferred in the input documents used and identified throughout Sciencetech's calculation by inference according to context and use.

It was assumed that all MSIV leakage is released at a rate of one percent of the turbine-condenser volume per day to the Turbine Building, where it is then released to the environment with no additional holdup or removal. It was also assumed that there is sufficient time to isolate the Reactor Building and the normal Control Room intake due to a 30 minute delay in core damage for a LOCA. Both SGT fans are assumed to be in operation for the first hour and one SGT fan after 1 hour due to operator action to isolate the second fan.

The assumptions were reviewed and found to be acceptable.

4. **Methodology** - The methodology is described in Section 3, Technical Approach. In general, the Sciencetech-NUS computer code AXIDENT is used to predict the radiological dose consequences of the postulated Loss of Coolant Accident at the 3 receptor locations:

1. Control Room,
2. Exclusion Area Boundary (EAB), and
3. Low Population Zone (LPZ).

The AXIDENT code models the transport of radioactivity to the environment and to the control room. This code accounts for HVAC recirculation, filtration, atmospheric dispersion, and natural decay. The AXIDENT computer code version used is listed in Section 7. Supporting calculations for the Control Room volume, MSIV leak rate, and ESF leakage values used as input to the code are given in section 8. Calculations are also included in Section 8 to determine the effective SGTS and Control Room filter efficiencies and to adjust the Control Room X/Q values to account for Control Room occupancy factors. Separate computer runs were performed for the three release paths considered: containment release, ESF leakage, and MSIV leakage. Separate runs were also performed considering either 50% mixing (extended release) or no mixing (instantaneous release) in the secondary containment. The computer output for each of these scenarios is listed in Attachment 1 for the Control Room and LPZ doses and in Attachment 2 for the EAB doses. The total dose for a given receptor location is the sum of the doses from the containment release, ESF leakage, and MSIV leakage.

 Rev. No: 0 Date: 12/3/99 Date: 12/9/99

The methodology was reviewed and found to be acceptable.

5. **Results / Conclusions** - Results and conclusions are given in Sections 10 and 11, respectively, of Sciencetech's calculation. Table 9 lists the calculated dose consequences for the Control Room, EAB, and LPZ. Separate results are presented for the extended (50% mixing) and instantaneous (no mixing) secondary containment release scenarios. The calculated doses for both scenarios are summarized in the table below. The regulatory limits listed in this table are from Table 1 of the Sciencetech calculation.

TABLE 1: SUMMARY OF LOCA ACCIDENT DOSES

	Control Room (30 days)			EAB (2 hours)		LPZ (30 days)	
	Thyroid	Whole Body	Beta	Thyroid	Whole Body	Thyroid	Whole Body
Extended Release Dose (rem)	3.88	4.16E-3	0.165	0.216	6.38E-2	22.6	0.888
Instant. Release Dose (rem)	3.88	4.29E-3	0.166	5.28	2.11	37.4	4.66
Limit (rem)	30	5	30	300	25	300	25

The results and conclusions sections were reviewed and found to be acceptable. All calculated doses are below the corresponding regulatory limits.

ENGINEERING CALCULATION

CLIENT/PROJECT NPPD/Cooper CALC. NO. 17080 -M-03 REV. 0

TITLE Control Room, EAB, and LPZ Doses Following a LOCA

AUTHOR/DATE: <i>Harry A. Wagage</i> 12/3/1999	VERIFIED BY/DATE: <i>STUDNEY DIST</i> 12/3/99	APPROVED BY/DATE: <i>D. Stud</i> For M.D.D. 12/3/99
--	--	--

Purpose

The purpose of this calculation is to determine the doses to the control room operator and to a person at the Exclusion Area Boundary (EAB) and at the Low Population Zone (LPZ) of the Cooper Nuclear Station (CNS) following a design basis loss-of-coolant accident.

Results

The AXIDENT code predicted doses to control room operator and to a person located at EAB and LPZ are listed in Table 9. Doses for the instantaneous secondary building release is the same as that for the extended release at the control room: differences occur in the third significant figure. The main reason is that the dominant contributor to the control room dose is the release through the MSIV, which is not affected by the rate of release from the secondary building. The differences are evident for doses at EAB and LPZ with instantaneous releasing giving higher doses than extended release. All the calculated doses are below the regulatory limits listed in Table 1.

Control Room, EAB, and LPZ Doses Following a LOCA		<i>[Signature]</i>	12/3/99

1 PURPOSE OF ANALYSIS

The purpose of this calculation is to determine the doses to the control room operator and to a person at the Exclusion Area Boundary (EAB) and at the Low Population Zone (LPZ) of the Cooper Nuclear Station (CNS) following a design basis loss-of-coolant accident (LOCA).

2 INTENDED USE OF ANALYSIS RESULTS

This analysis is intended to confirm that the calculated doses resulting from a design basis LOCA for the control room operator, a person at the EAB, and a person at the LPZ are less than the Regulatory dose limits as given in Table 1.

Table 1. Regulatory Dose Limits (Rem)

Dose Type	CR (30 day)	EAB (2 hour)	LPZ (30 day)
Thyroid Dose	30 ^a	300 ^b	300 ^b
Whole Body Dose	5 ^{a, c}	25 ^b	25 ^b
Beta Skin Dose	30 ^a	-	-

Notes: ^a SRP, Section 6.4, Acceptance Criteria-6 [5.1]

^b 10 CFR Part 100, section 100.11 [5.2]

^c 10 CFR Part 50, GDC-19, Appendix A [5.2]

3 TECHNICAL APPROACH

The radiological doses to the control room operators and to a person located at the EAB and LPZ resulting from the design basis LOCA were assessed using the SCIENTECH-NUS "AXIDENT" computer code which is a transient control room and off-site dose analysis code. Three pathways of radiological releases from the containment were considered. The first was the release from the containment through the standby gas treatment system (SGTS). The second was the release from the emergency safety features (ESF) leakage into containment through the SGTS. The third was the release through the main steam isolation valves (MSIV) through the turbine building. Resultant doses were calculated by summing the doses from individual release paths. Figures 1 and 2 show schematics of the release model and control room flow model. The data shown on figures 1 and 2 were derived as described later in the report.

NUREG/CR-5009 notes that extended burnup fuel would not affect the LOCA releases, and therefore, extended burnup fuel was not considered in the present analysis. [5.17]

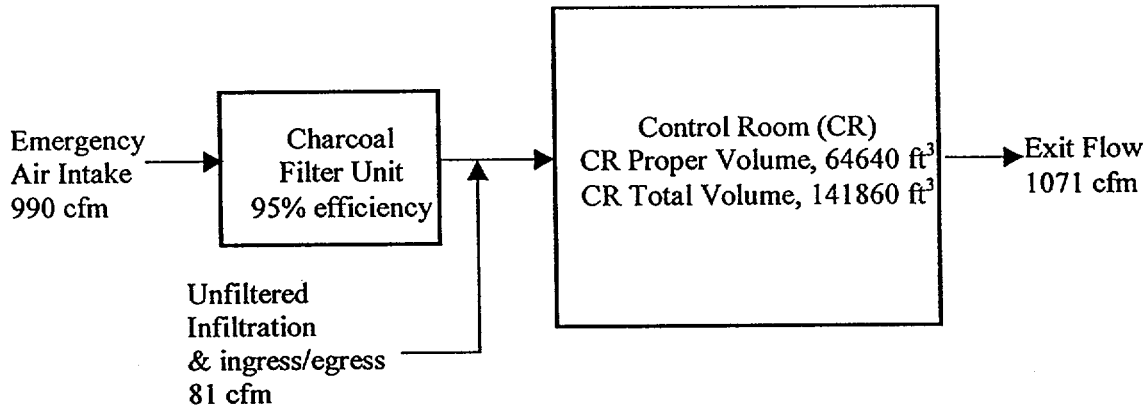

Figure 2. Schematic of Control Room Air Flows

3.1 Radioactive Release Pathways

3.1.1 Release from the Containment through SGTS

At the time of the accident, 25% of all equilibrium iodine fission products and 100% of the noble gas fission products are assumed to be available for release from the containment within a short time (effectively immediately) after the accident (SRP 15.6.5). [5.1] Fission products released to the containment are assumed to release through the standby gas treatment system (SGTS) to the environment via the elevated release point (ERP). The SGTS filters will remove part of the iodine isotopes. The analysis was performed considering both partial mixing and with no mixing in the secondary containment. SRP 6.5.3 allows credit for mixing in 50% of the secondary containment volume. [5.1] The use of holdup in a portion of the secondary containment is acceptable for control room analyses, however, for off-site analyses, it is usually ignored for conservatism.

3.1.2 Release from ESF Leakage through SGTS

The dose contribution from radioactive leakage through engineered safety feature (ESF) system or components is subject to the requirements of SRP 15.6.5, Appendix B. [5.1] The ESF control room dose contribution is modeled separately and added to the doses from the SGTS and MSIV leakage. Fifty percent of core iodine inventory, based on maximum reactor power level, is mixed in the suppression pool water circulating through the containment external piping systems. In accordance with SRP 15.6.5, Appendix B, the iodine is assumed to be uniformly mixed in the minimum volume of the pressure suppression pool water.

SCIENTECH/NUS, Inc. and Subsidiaries		STANDARD CALCULATION SHEET	
CLIENT:	FILE NO.:	BY:	PAGE:
NPPD/Cooper	17080 -M-03	Harry A. Wagage	8 of 33
SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>HW</i>	12/2/99

With a temperature of the suppression pool water circulating outside of containment not exceeding 212°F, the flash fraction is taken to be 10%, consistent with SRP 15.6.5, Appendix B under a condition of no boiling. Ten percent of the iodine in the leakage is thus assumed to become airborne. The airborne activity released by flashing ESF water was conservatively assumed to release to the environment through SGTS without further mixing with the air in the Reactor Building.

3.1.3 Release from MSIV Leakage through Turbine Building

The majority of the containment leakage is collected in the reactor building and exhausted to the atmosphere through the SGTS filters to the environment via the elevated release point (ERP). However, there are certain release pathways in BWRs from the containment, which will bypass the SGTS filters.

CNS was designed and licensed prior to the adoption of Leakage Control Systems (LCS) which were installed in newer plants to further mitigate the consequences of the leakage down this release path. The original LOCA radiological consequence analysis in the CNS SER, [5.3] along with SERs for similar vintage plants, was silent on the effects of the MSIV leakage. This may be due to a general perception that the excessively conservative TID-14844 reactor siting type analysis envelops the consequence of these types of release paths. [5.4] This release path was reviewed, on an industry level, in SEP Topic XV-19, "Radiological Consequences of Loss of Coolant Accident from Pipe Breaks within the Reactor Coolant Pressure Boundary."

For this CNS LOCA radiological transport and dose analysis, the model will conservatively add the effects of the MSIV leakage. A conservative model, which is similar to one employed at other non-LCS vintage plants, will be used. The model, which is more conservative than the current industry accepted methodology as documented in NUREG/CR-6189 in relation to the removal mechanisms, does however credit the effects of limited partitioning and plateout in the turbine condenser complex. [5.29] The crediting of the non-seismic condenser, which may not be appropriate for newer plants that are requesting to eliminate the safety-related LCS and add a new release path, is considered appropriate for a licensed plant with an existing release path. This is very conservative approach since even very smallest deposition velocities result in essentially all of the elemental and particulate iodines being removed (a DF of 25 is typically calculated for this type of release path). Furthermore, the DF of 10 for all the iodines in the release path is similar to the partitioning and plateout in the turbine and condensers allowed in SRP 15.4.9 [5.1].

CLIENT: NPPD/Cooper	FILE NO.: 17080 -M-03	BY: Harry A. Wagage	PAGE: 9 of 33
SUBJECT: Control Room, EAB, and LPZ Doses Following a LOCA		CHECKED BY: DAS	DATE: 12/3/99

In summary, the model developed for analyzing the existing MSIV leakage is conservative and within industry precedence for BWR's of CNS' vintage. While the modeling is considered acceptable for analyzing the existing MSIV leakage path, the treatment would need to be reevaluated if used in support of a change to the MSIV leakage rates. That is, it is anticipated that seismic analysis and justification would be necessary if the model is used to support an increase in the allowable MSIV leakage.

The bypass leakage was quantified by assuming that all MSIV seats leak at the Technical Specification limit. The leak rate was corrected to the containment design pressure, using the laminar (viscous) flow extrapolation factors of ORNL NSIC-5. Radioactivity leaking past the isolation valves could be released through the outboard MSIV stems into the steam tunnel or the turbine-condenser complex. Any stem leakage into the steam tunnel is exhausted by the SGTS filtration system, thus eliminating it as a bypass pathway. For conservatism, all MSIV seat leakage is assumed to release via the Turbine Building with no holdup or removal; no MSIV seat leakage was assumed to enter the steam tunnel and released via SGTS.

Leakage down the steam lines is subject to plateout and delay within the lines. NUREG/CR-0009, Section 5.1.2 discusses iodine removal rates, which can be applied to calculate plateout on the piping and turbine-condenser surfaces. [5.5] Elemental and particulate iodine decontamination factors of over 100 can be calculated for small travel distances and long travel times down the steam lines, considering the small volume of leakage which passes the valves (§4.7.1).

The MSIV leakage travels down the steam piping to the turbine condenser complex where it is conservatively assumed to release at ground level, at a rate of 1% of the turbine-condenser volume per day. This leak rate is consistent with the conservative condenser leak rate used for the control rod drop accident in SRP 15.4.9. [5.1] Furthermore, it was conservatively assumed that radioactivity released into the turbine building is instantaneously released to the environment (i.e., no credit for holdup/mixing in the turbine building).

In actuality, the MSIV leakage passes through three different volumes, which provide holdup and the opportunity for plateout. The first volume consists of the steam lines between the inboard and outboard isolation valves. The second volume consists of the steam lines between the outboard isolation valves and the turbine stop valves. The third volume includes the steam lines after the turbine stop valves and the internal volume of the turbine-condenser complex. For additional conservatism, the removal of organic iodine through plateout was not considered.

The MSIV leakage will be released into the turbine building where it would be exhausted by the heating, ventilating, and air conditioning (HVAC) system if the HVAC were working. Additional plateout on ductwork, fans, and unit coolers would further minimize the iodine release. Should the HVAC system not be working, then any bypass leakage would tend to collect in the building and be subject to additional decay and plateout. However, once the MSIV leakage reaches the turbine building, it was conservatively assumed that no additional plateout or decay occurs.

3.2 Control Room Model

Figure 2 shows a schematic of the control room flow model.

SRP 6.4 suggests a 20-minute delay for manual isolation of the control room ventilation system when performing dose evaluations. [5.1] However, NUREG 1465 recognizes that core failure does not start until approximately 30 minutes after the initiation of a LOCA accident. [5.6] Because of the delay of core melting it was assumed that there is sufficient time to isolate the normal control room intake and to activate the control-room emergency ventilation system.

Radioactive material enters the control room with filtered air intake through the emergency ventilation system and with unfiltered in-leakage and ingress/egress. Air is assumed to exit the control room along with radioactivity in it at a flow rate equal to that is entering the control room. No air circulation filters were assumed to be in operation, therefore, the only mechanisms of radioactivity removal from the control room are radioactive decay and release with air exiting the control room.

3.3 Source Term Model

The core is assumed to have operated at the design power level plus 2%, to account for uncertainties in power measurement, for a sufficiently extended period (typically about 3 years) such that the maximum equilibrium of fission products is present (SRP 15.6.5). [5.1] The iodine in the core is assumed to consist of 91% elemental iodine, 4% organic iodine, and 5% particulate iodine (SRP 15.6.5). Consistent with TID-14844, the AXIDENT code calculates the source term based on operation at given reactor power for 1000 days (2.74 years) and the above partition of iodine isotopes. [5.5, 5.7] As such, the source term is independent of the fuel type.

The AXIDENT code calculated source term was used for two release paths, 1) release from the containment atmosphere through SGTS and 2) release from the MSIV leakage through the turbine building. [5.7] However, for the release from ESF no noble gas is available

SCIENTECH/NUS, Inc. and Subsidiaries		STANDARD CALCULATION SHEET

SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>DMS</i>	4/3/99

because all the noble gasses were assumed to release into the containment atmosphere. Therefore, only iodine isotopes were used as the source term. The AXIDENT code reduces the iodine source term by a factor of 4 to account for the standard Reg. Guide 1.3 assumptions of 50% airborne release and 50% plate-out factor. [5.8] Thus, the desired iodine source term must be multiplied by a factor of 4 to cancel the reduction made by the program. To achieve an ESF source term of 50% of the core inventory, the core inventory must be multiplied by a factor of 2. Credit is not taken for plate-out of the ESF leakage term.

3.4 Atmospheric Dispersion Factors (X/Qs)

Control room dose calculations were performed using atmospheric dispersion factors (X/Q values) for the control room ventilation calculated using ARCON96 computer code (SCIENTECH Calculation 17080-M-01; see §4.8). [5.9, 5.10] The ARCON96 code used site-specific information for CNS, including weather data.

Dispersion factors for the EAB and LPZ were obtained from SCIENTECH Calculation 17080-M-06 (see §4.9 and 4.10). [5.11]

3.5 Pressure Suppression Pool Scrubbing

Pressure suppression pool scrubbing with an NRC recommended minimum decontamination factor of 5 was used to reduce the amount of particulate and elemental iodine leaking from the primary containment to the secondary containment in accordance with SRP 6.5.5.III.1. [5.1] The SRP notes that, for a Mark I containment, the applicant's decontamination factor of 5 or less may be accepted without any need to perform calculations.

The initial isotopic activity airborne in the primary containment may be adjusted to account for the suppression pool scrubbing effect on iodine. Activity released from the core during the blowdown phase of a LOCA will be mixed in the drywell atmosphere. As a result of the pressure buildup in the drywell, the steam/air mixture in the drywell will be forced through the downcomers into the suppression pool (which is at a lower pressure) where condensable vapors are removed. In the process of passing through the suppression pool water, iodine fission products are scrubbed. The scrubbing of iodine is limited to particulate and elemental iodine because organic iodine is given a DF of 1 per SRP 6.5.5.III.1. [5.1] Based on pool DF data presented in NEDO-25420, suppression pool scrubbing factors of 30 to 1000 are justifiable for elemental and particulate iodine species. [5.12] With an instantaneous release of fission products postulated at the start of a LOCA, a large break LOCA would result in most of the blowdown and activity passing rapidly through the suppression pool.

A slower, more mechanistic activity release would result in less activity being available instantaneously for release to the reactor enclosure. However, the slow release would be accompanied by steam and hydrogen (e.g., NUREG/CR-2540), which would pressurize the

CLIENT:	FILE NO.:	BY:	PAGE:

SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>ms</i>	12/3/99

drywell and force flow through the suppression pool where significant quantities of iodine would still be removed. [5.13] In addition, emergency cooling water circulating from the reactor to the drywell through the suppression pool and back to the core by core spray and LPCI would contribute to scrubbing of iodine being released from the core long after blowdown. As a result, the fission products that are released through the MSIV leak path, which may bypass the suppression pool but is still in contact with suppression pool water, will also be scrubbed. However, no scrubbing was assumed for fission products released through the MSIV leak path.

3.6 ICRP 30 DCFs

The existing licensing basis accident analysis is based on the Dose Conversion Factors (DCFs) from Regulatory Guide 1.3 and TID-14844, which were developed in the early 60s. [5.8, 5.4] Since the development of Reg. Guide 1.3, work has been and continues to be performed in both the U.S. and overseas on developing new DCFs. RG 1.109 recommends DCFs that are significantly lower than those specified in RG 1.3 or TID-14844. [5.8, 5.4] ICRP Publication 30, "Limits for Intakes of Radionuclides by Workers," issued in 1979, provides more accurate DCFs. Although these DCFs have not been included in a Regulatory guide for use in accident analyses, they have been submitted and approved by NRC in a number of Post-TMI Control Room Habitability analyses. This analysis will use the ICRP 30 Dose Conversion Factors. [5.14] The various DCFs are compared in Table 2.

Table 2. Comparison of Different Dose Conversion Factors for Iodine Isotopes

Isotope	Dose Conversion Factor (Rem/Ci)		
	ICRP 2 [5.15]	RG 1.109 [5.8]	ICRP 30 [5.14]

I-133	4.00E+5	2.69E+5	1.80E+5
I-134	2.50E+4	3.73E+3	1.10E+3
I-135	1.24E+5	5.60E+4	3.10E+4

3.7 Design MSIV Leak Rate

The design MSIV leak rate for CNS is calculated by correcting the maximum MSIV leak rate allowed at test pressure to that at the design pressure using the laminar (viscous) flow extrapolation method described in ORNL-NSIC-5 (page 10-52). [5.16] The extrapolation factor formula for laminar flow is given by equation 1:

CLIENT:	FILE NO.:	BY:	PAGE:

SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>HW</i>	12/3/97

$$\frac{L_e}{L_t} = \frac{P_e - \frac{1}{P_e}}{P_t - \frac{1}{P_t}} \quad (1)$$

where:

- L_e/L_t = Extrapolation Factor
- P_e = Extrapolated Pressure (atmospheres)
- P_t = Test Pressure (atmospheres)

3.8 Resultant Iodine Removal Efficiencies for SGTS/Control-Room-Intake Filters

Different flow rates and removal efficiencies are assumed for the operating- and idle-SGTS trains.

There are two supply pathways into the control room, a filtered air supply and an unfiltered inleakage pathway. AXIDENT does not provide for two removal pathways from secondary containment with different filter efficiencies nor does it provide for both a filtered and an unfiltered supply to the Control Room. Each of the dual pathways is modeled as a single pathway with net removal efficiency. The net (resultant) iodine removal efficiencies for each of these pathways were calculated using equation 2, which is derived using conservation of mass.

$$\eta_{i\ res} = \frac{\left(\eta_i \overset{\circ}{V}\right)_1 + \left(\eta_i \overset{\circ}{V}\right)_2}{\left(\overset{\circ}{V}\right)_1 + \left(\overset{\circ}{V}\right)_2} \quad (2)$$

where:

- $\eta_{i\ res}$ = Resultant value of SGTS/control-room-intake filter efficiency for iodine isotope of form "i".
- η_i = Individual efficiency of idle or operating train of SGTS/control-room-intake filter for iodine isotope of form "i". Note, η_i for unfiltered control room intake is zero.
- $\overset{\circ}{V}$ = Airflow rate through idle or operating train of SGTS filter/ unfiltered or filtered airflow rate into the control room.

Subscripts 1 and 2 in equation 2 refer to idle and operating trains for SGTS or unfiltered and filtered flow for control room intake.

3.9 Secondary Containment Release Rate

Two cases of secondary containment release rate were analyzed: instantaneous release and extended release. The instantaneous release case is based on Regulatory Guide 1.3, in which leakage from primary to secondary is assumed to pass directly to the SGTS, where it is then discharged to the environment via the elevated release point. [5.8] A large release rate of 1 secondary building volume per second was used for this case.

The extended release case was based on SRP 6.5.3.II.2, which allows mixing with 50 percent of the secondary containment volume. [5.1] A holdup effect of the secondary containment, equivalent to mixing in 100 percent of the secondary volume, was used in the earlier licensing basis dose analysis and was subsequently accepted by the NRC. However, for additional conservatism and to be in compliance with SRP 6.5.3, mixing within 50 percent of the secondary containment volume was used in the present analysis so that a higher concentration was to be discharged to the environment. The design flow rate of SGTS, 1 secondary building volume per day was doubled and used as input to the AXIDENT code to account for 50% mixing in the secondary building. [5.7]

6 MAJOR ASSUMPTIONS

Table 4 lists the major assumptions used in the present analysis.

Table 4. Major Assumptions Used

No.	Item	Value	Comments
6.1	Mixing:		
	Primary Containment	100%	Conservative to assume MSIV leakage goes directly to environment without holdup in the Turbine Building.
	Turbine Building (MSIV leakage)	0%	
	Control Room	100%	Most activity enters prior to isolation of Control Room via the supply air fans. The supply air is well mixed with the room air by means of the recirculation system.
Secondary Containment	0%/50%	No mixing per Reg. Guide 1.3 and 50%, this case is run to allow for a comparison with the SER type analysis. [5.8, 5.1] 50% mixing per SRP 6.5.3 (see §3.1.1). [5.1]	
6.2	Secondary Containment leak rate after SGTS startup, vol./sec	1	Instantaneous release, which does not allow holdup, was conservatively assumed.
6.3	Turbine Building leak rate, vol./sec	1	Instantaneous release, which does not allow holdup, was conservatively assumed.
6.4	Time following initiation of accident at which normal control room intake is isolated, sec	0	For LOCA, 30-minute delay in core damage (NUREG 1465) allows assumption that CR has been isolated. [5.6]

No.	Item	Value	Comments
6.5	Time following initiation of accident at which realignment from normal containment ventilation to SGTS ventilation takes place, sec	0	For LOCA, 30-minute delay in core damage (NUREG 1465) allows assumption that Reactor Building has been isolated. [5.6]
6.6	Removal DF for all iodine species in the condenser:	10	See §3.1.3 discussion.

7 COMPUTER CODES AND COMPUTER USED

The AXIDENT program was executed on a Dell Latitude laptop computer running a Windows NT Version 4.0 operating system as currently assigned to Harry A. Wagage. Satisfactory operation of the AXIDENT code on this computer has been confirmed by revalidation. Satisfactory operation of the AXIDENT code on this computer has been confirmed by revalidation. [Ref. 5.28] The original "AXIDENT" code library data used the very conservative DCFs that were in effect and used for the design basis 10CFR100 type reactor siting analyses (i.e., TID 14844 and ICRP Publication 2). [5.2, 5.4, 5.15] During this calculation the AXIDENT-code library data file was changed to use the newer and more accurate DCFs presented in ICRP 30. [5.14] See section 3.6 for additional discussion. A listing of the updated library (with the changes indicated) is provided in attachment 5.

8 DETAILED CALCULATIONS

8.1 Control Room Volume

Control Room parameters provided in §4.8.5.

Control Room proper

$$\text{Height} = 949'1.5'' - 932'6'' = 16.625' -$$

$$\text{Volume} = (72') * (67.5') * (16.625') = 80,800 \text{ ft}^3$$

Cable Room

$$\text{Height} = 932'6'' - 918' = 14.5'$$

$$\text{Volume} = (72') * (67.5') * (14.5') + (37.25') * (48.25') * (14.5') = 96,530 \text{ ft}^3$$

$$\text{Total volume} = 80,800 + 96,530 = 177,330 \text{ ft}^3$$

Assuming 20% of the volumes include walls, floors, and equipment, the net volumes are:

$$\text{Control Room proper} = 64,640 \text{ ft}^3$$

$$\text{Control Room envelope} = 141,860 \text{ ft}^3$$

8.2 Additional Input to AXIDENT code

8.2.1 Design MSIV Leak Rate

The extrapolation factor from measured to design leak rate through MSIVs is calculated by substituting the following values into equation 1 in §3.7.

Design pressure, psig (atm) (§4.7.2)	29 (2.97)
Design pressure, psig (atm) (§4.7.4)	58 (4.95)

$$\frac{L_e}{L_t} = \frac{4.95 - \frac{1}{4.95}}{2.97 - \frac{1}{2.97}}$$

$$= 1.80$$

The design leak rate through the MSIVs is calculated as follows:

Maximum leak rate through MSIV at test pressure, scfh/valve (§4.7.1)	11.5
Number of outboard MSIVs (§4.7.3)	4
Total leak rate through MSIVs at test pressure, scfh (4 x 11.5 scfh)	46
Total leak rate through MSIVs at design pressure, scfh (1.80 x 46 scfh)	82.8

The fractional leakage of containment through the MSIVs based on primary containment volume per §4.4.1:

$$= [(1 \text{ atm}) / (4.95 \text{ atm})] (82.8 \text{ scfh}) (24 \text{ hr/day}) (1/2.391 \text{E}5 \text{ ft}^3) (100\%)$$

$$= 0.168 \text{ \% -vol./day}$$

$$= 1.94 \text{E-}8 \text{ vol./sec}$$

8.2.2 ESF Leakage

Per §4.4.3,

- Mass fluid in reactor vessel = 437,000 lb
- Mass fluid in primary piping system = 89,000 lb
- Total mass = 526,000 lb

Given a specific volume of 0.01672 ft³/lb for water at 212 F (ASME Steam Tables), the fluid volume is 8795 ft³.

Note that the values provided in §4.4.3 are for standard plant 218T548, but are considered adequate for estimating values for CNS. The fluid volume is less than 10% of the total volume and therefore inconsistencies with these values will have a minimal effect on the results of the calculation.

CLIENT:	FILE NO.:	BY:	PAGE:
NPPD/Cooper	17080 -M-03	Harry A. Wagage	28 of 33
SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>DW</i>	12/3/99

The ESF leak rate was calculated using the following values:

ESF Leak Data (directly to SGTS), cc/min (§4.6.1)	1000
ESF flashing fraction (§4.6.2)	10%
Volume of water in the suppression pool, ft ³ (§4.4.3)	87,650
Volume of reactor coolant, ft ³	8,795
Total ESF volume, ft ³	96,445

The leakage of ESF as a fraction of the suppression pool volume

$$= (1000 \text{ cc/min})(1 \text{ min}/60 \text{ s})(1\text{E-}6 \text{ m}^3/\text{cc})(35.3 \text{ ft}^3/\text{m}^3)(10\%)/(96445 \text{ ft}^3)$$

$$= 6.10\text{E-}10 \text{ sup.-pool-vol./sec}$$

$$= 0.005 \text{ \%sup. pool vol./day}$$

The initial activity in the suppression pool as listed in table 5 was obtained by multiplying the source term developed by AXIDENT in the base containment release case (Attachment 1a1) by 2 as described in § 3.3.

Table 5. Core Inventory and ESF Leakage Source Term

Isotope	Core Inventory from Attachment 1a1 (Ci)	ESF Leakage Source Term (Ci)
I-131	6.114E7	1.22E8
I-132	9.098E7	1.82E8
I-133	1.406E8	2.81E8
I-134	1.639E8	3.28E8
I-135	1.303E8	2.61E8

8.2.3 Resultant Iodine Removal Efficiencies and Non-Removal Factors for SGTS/Control-Room-Intake Filters

Resultant iodine removal efficiencies for SGTS filters were calculated using equation 2 in §3.8 as given in Table 6. The non-removal factor (NRF) is equal to one minus the efficiency; this is used for SGTS treatment of ESF leakage. The suppression pool decontamination factor of 5 for elemental and particulate iodine was incorporated into the non-removal factor (§4.4.2); this is used for SGTS treatment of containment leakage.

CLIENT:	FILE NO.:	BY:	PAGE:
NPPD/Cooper	17080 -M-03	Harry A. Wagage	29 of 33
SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>DJJ</i>	12/3/97

Table 6. Resultant Iodine Removal Efficiencies and Non-Removal Factors for SGTS Filters

	Active	Inactive	Total		
0 – 1 h: both trains operate; heater power to one train failed					
Flow rate (cfm)	1492	1492	2984		
	Efficiency	Efficiency	Efficiency	NRF (1)	NRF incl. DF (2)
Elemental iodine	95%	90%	93%	7.50E-2	1.50E-2
Particulate iodine	95%	95%	95%	5.00E-2	1.00E-2
Organic Iodine	95%	30%	63%	0.375	0.375
0 – 1 h: one train operates; the train w/ failed heater power shut off					
Flow rate (cfm)	1492	288	1780		
	Efficiency	Efficiency	Efficiency	NRF (1)	NRF incl. DF (2)
Elemental iodine	95%	90%	94%	5.81E-2	1.16E-2
Particulate iodine	95%	95%	95%	5.00E-2	1.00E-2
Organic Iodine	95%	30%	84%	0.155	0.155

Notes:

1. NRF = non-removal factor = 1 – efficiency
2. NRF incl. DF incorporates suppression pool DF of 5 for elemental and particulate iodine.

Resultant iodine non-removal factors for control room intake were calculated using the following Control Room design input in equation 2.

Unfiltered infiltration, scfm (§4.8.1)	71
Unfiltered ingress/egress, scfm (§4.8.1)	10
Total unfiltered intake, scfm (71 + 10)	81
Emergency supply air rate, scfm (900 scfm ± 10%) (§4.8.2)	990
Charcoal filter efficiency for all iodine species (§4.8.3)	95%
Total control room intake, scfm (81 + 990)	1071

Resultant removal efficiency for all iodine types for control room intake

$$= [(81 \text{ scfm})(0\%) + (990 \text{ scfm})(95\%)] / (1071 \text{ scfm})$$

$$= 87.82\%$$

= 0.1218

8.2.4 Iodine Non-Removal Factors for Turbine Building for MSIV Leakage

The removal of iodine isotopes by condenser is modeled in the AXIDENT code as filter non-removal factors for the turbine building, which is treated as the secondary building. The iodine removal DF for all iodine species in the condenser is 10 (§6.6). Therefore, the non-removal factor for all iodine types is 0.10 (=1/10).

8.2.5 X/Q Values for Control Room Intake

The site-specific values of X/Q for the control room intake that were calculated using the ARCON96 code were updated for the occupancy factors as given in Table 7.

Table 7. Control Room Intake X/Q Values, Updated for Control Room Occupancy Factors

Duration	X/Q (s/m ³) (§4.8.8)	Occupancy Factor (§4.8.7)	Resultant X/Q (s/m ³)
MSIV Leakage			
0 - 2 hr	5.24E-4	1	5.24E-4
2 - 8 hr	2.68E-4	1	2.68E-4
8 - 24 hr	1.41E-4	1	1.41E-4

SUBJECT:		CHECKED BY:	DATE:
Control Room, EAB, and LPZ Doses Following a LOCA		<i>Das</i>	12/3/99

- Spray removal rates = 0
- Mixing flow rate between sprayed and unsprayed regions = 1
- Sprayed region volume = 1
- Unsprayed region volume = Primary Containment volume = 239,100 ft³

Secondary Removal Rate

- 2 volumes per day (1 day/24 hour) (1 hour/3600 sec) = 2.31E-5 sec⁻¹

9 COMPUTER INPUT AND OUTPUT

Two distinct cases of the release from the Secondary Building, instantaneous release (1 vol./s) and extended release (2 vol./day) were analyzed. The AXIDENT code output for different runs that were performed are given in attachments as shown in the Table 8. At the beginning of each output is the listing of input values.

Table 8. Attachment Numbers Giving AXIDENT Code Output for Different Cases

Release Path	LPZ and Control Room		EAB	
	0 - 1 h	1 h - 30 d	0 - 1 h	1 h - 2 h
Instantaneous Secondary Building Release (1 vol./s) Case				
SGTS Release: Containment	1a1	1a2	2a1	2a2
SGTS Release: ESF	1b1	1b2	2b1	2b2
MSIV Leakage*	1c		2c	
Extended Secondary Building Release (2 vol./day) Case				
SGTS Release: Containment	3a1	3a2	4a1	4a2
SGTS Release: ESF	3b1	3b2	4b1	4b2
MSIV Leakage*	1c		2c	

* Note: MSIV leakage is independent on the secondary building release rate; thus, the same runs are used for both cases.

10 SUMMARY OF RESULTS

The AXIDENT code predicted doses to control room operator and to a person located at EAB and LPZ are listed in Table 9. Doses for the instantaneous secondary building release is

the same as that for the extended release at the control room: differences occur in the third significant figure. The main reason is that the dominant contributor to the control room dose is the release through the MSIV, which is not affected by the rate of release from the secondary building. The differences are evident for doses at EAB and LPZ with instantaneous releasing giving higher doses than extended release. All the calculated doses are below the regulatory limits listed in table 1.

11 CONCLUSIONS

The AXIDENT code predicted doses to control room operator and to a person located at EAB and LPZ are listed in Table 9.

The no mixing/instantaneous release is provided to allow for comparison with the original SER analysis and to identify the effect of the mixing. The proposed design and licensing basis is to credit mixing in the secondary as is allowed in the SRP's. Doses for the instantaneous secondary building release is the same as that for the extended release at the control room: differences occur in the third significant figure. The main reason is that the dominant contributor to the control room dose is the release through the MSIV, which is not

SHEET 81 OF 108

ELEMENTAL

Table with 11 columns and 5 rows of elemental data (I-131, I-132, I-133, I-134, I-135).

PARTICULATE

Table with 11 columns and 5 rows of particulate data (I-131, I-132, I-133, I-134, I-135).

ORGANIC

Table with 11 columns and 5 rows of organic data (I-131, I-132, I-133, I-134, I-135).

NOBLE GASES

Table with 11 columns and 10 rows of noble gas data (XE-131M, XE-133M, XE-133, XE-135M, XE-135, XE-138, KR-83M, KR-85M, KR-85, KR-87, KR-88).

ICRP 30 Change to AXIDENT Library File

The *AXIDENT* library file is a plain ASCII text file, which is read by the code. The dose conversion factors used in the original code are very conservative. They were in effect and used for the design-basis 10-CFR-100 type reactor siting analyses (i.e., TID 14844 and ICRP Publication 2). For this analysis, more realistic DCFs are used. The DCFs used are obtained from ICRP 30. This required a change to the *AXIDENT* library file. The changes made are shown below.

Section of original library file

I-131	9.97E-07	1.48E+06	2.91	0.197	0.371	9
I-132	8.37E-05	5.35E+04	4.33	0.448	2.40	34
I-133	9.17E-06	4.00E+05	6.69	0.423	0.477	6
I-134	2.22E-04	2.50E+04	7.8	0.455	1.939	24
I-135	2.87E-05	1.24E+05	6.2	0.308	1.779	25

Section of new library file

I-131	9.97E-07	1.10E+06	2.91	0.197	0.371	9
I-132	8.37E-05	6.30E+03	4.33	0.448	2.40	34
I-133	9.17E-06	1.80E+05	6.69	0.423	0.477	6
I-134	2.22E-04	1.10E+03	7.8	0.455	1.939	24
I-135	2.87E-05	3.10E+04	6.2	0.308	1.779	25

The complete library file used is presented below.
