Joseph M. Farley Nuclear Plant
Pressure Temperature Limits Reports and
Unit 2 Reactor Vessel Surveillance Capsule Z Results

Ladies and Gentlemen:

In accordance with Farley Units 1 and 2 Technical Specifications 5.6.6, Southern Nuclear Operating Company (SNC) hereby submits revisions to the Unit 1 and Unit 2 Pressure Temperature Limits Reports (PTLRs). Revision 1 was issued to each PTLR to support transition to the Improved Technical Specifications (ITS) and each revision contains only editorial changes.

In a related matter, SNC submitted Westinghouse report WCAP-15171, "Analysis of Capsule Z from the Alabama Power Company Joseph M. Farley Unit 2 Reactor Vessel Radiation Surveillance Program" by letter dated March 19, 1999. In that letter, SNC committed to revise the Unit 2 PTLR within one year if necessary following review of the Capsule Z test results. Changes have been made to the Capsule Z analysis previously submitted, therefore SNC hereby submits Revision 1 of WCAP-15171 in accordance with the provisions of 10 CFR 50 Appendix H. Review of this revised Capsule Z analysis has been completed and no revision of the Unit 2 PTLR was necessary since the existing heatup and cooldown limit curves remain conservative.

This letter contains no commitments. Please advise if you have any questions or need additional information.

Respectfully submitted,

Dave Morey

1.0 RCS Pressure Temperature Limits Report (PTLR)

This PTLR for Farley Nuclear Plant - Unit 1 has been prepared in accordance with the requirement of Technical Specification (TS) 5.6.6. Revisions to the PTLR shall be provided to the NRC after issuance.

This report affects TS 3.4.3, RCS Pressure/Temperature Limits (P/T) Limits. All TS requirements associated with low temperature overpressure protection (LTOP) are contained in TS 3.4.12, RCS Overpressure Protection Systems.

2.0 Operating Limits

The limits for TS 3.4.3 are presented in the subsection which follows and were developed using the methodologies specified in TS 5.6.6. The operability requirements associated with LTOP are specified in TS LCO 3.4.12 and were determined to adequately protect the RCS against brittle fracture in the event of an LTOP transient in accordance with the methodology specified in TS 5.6.6. The limitation on the number of operating reactor coolant pumps (RCPs) is necessary to assure operation consistent with the pressure corrections incorporated in the P/T limits for flow losses associated with the RCPs.

2.1 RCS Pressure/Temperature (P/T) Limits (LCO - 3.4.3)

2.1.1 The minimum boltup temperature is 75°F.

2.1.2 The RCS temperature rate-of-change limits are:

a. A maximum heatup of 100°F in any one hour period.
b. A maximum cooldown of 100°F in any one hour period.
c. A maximum temperature change of less than or equal to 10°F in any one hour period during inservice hydrostatic and leak testing operations above the heatup and cooldown limit curves.

2.1.3 The RCS P/T limits for heatup and cooldown are specified by Figures 2-1 and 2-2, respectively.

2.2 RCP Operation Limits

2.2.1 The number of operating RCPs is limited to one at RCS temperatures less than 110°F with the exception that a second pump may be started for the purpose of maintaining continuous flow while taking the operating pump out of service.

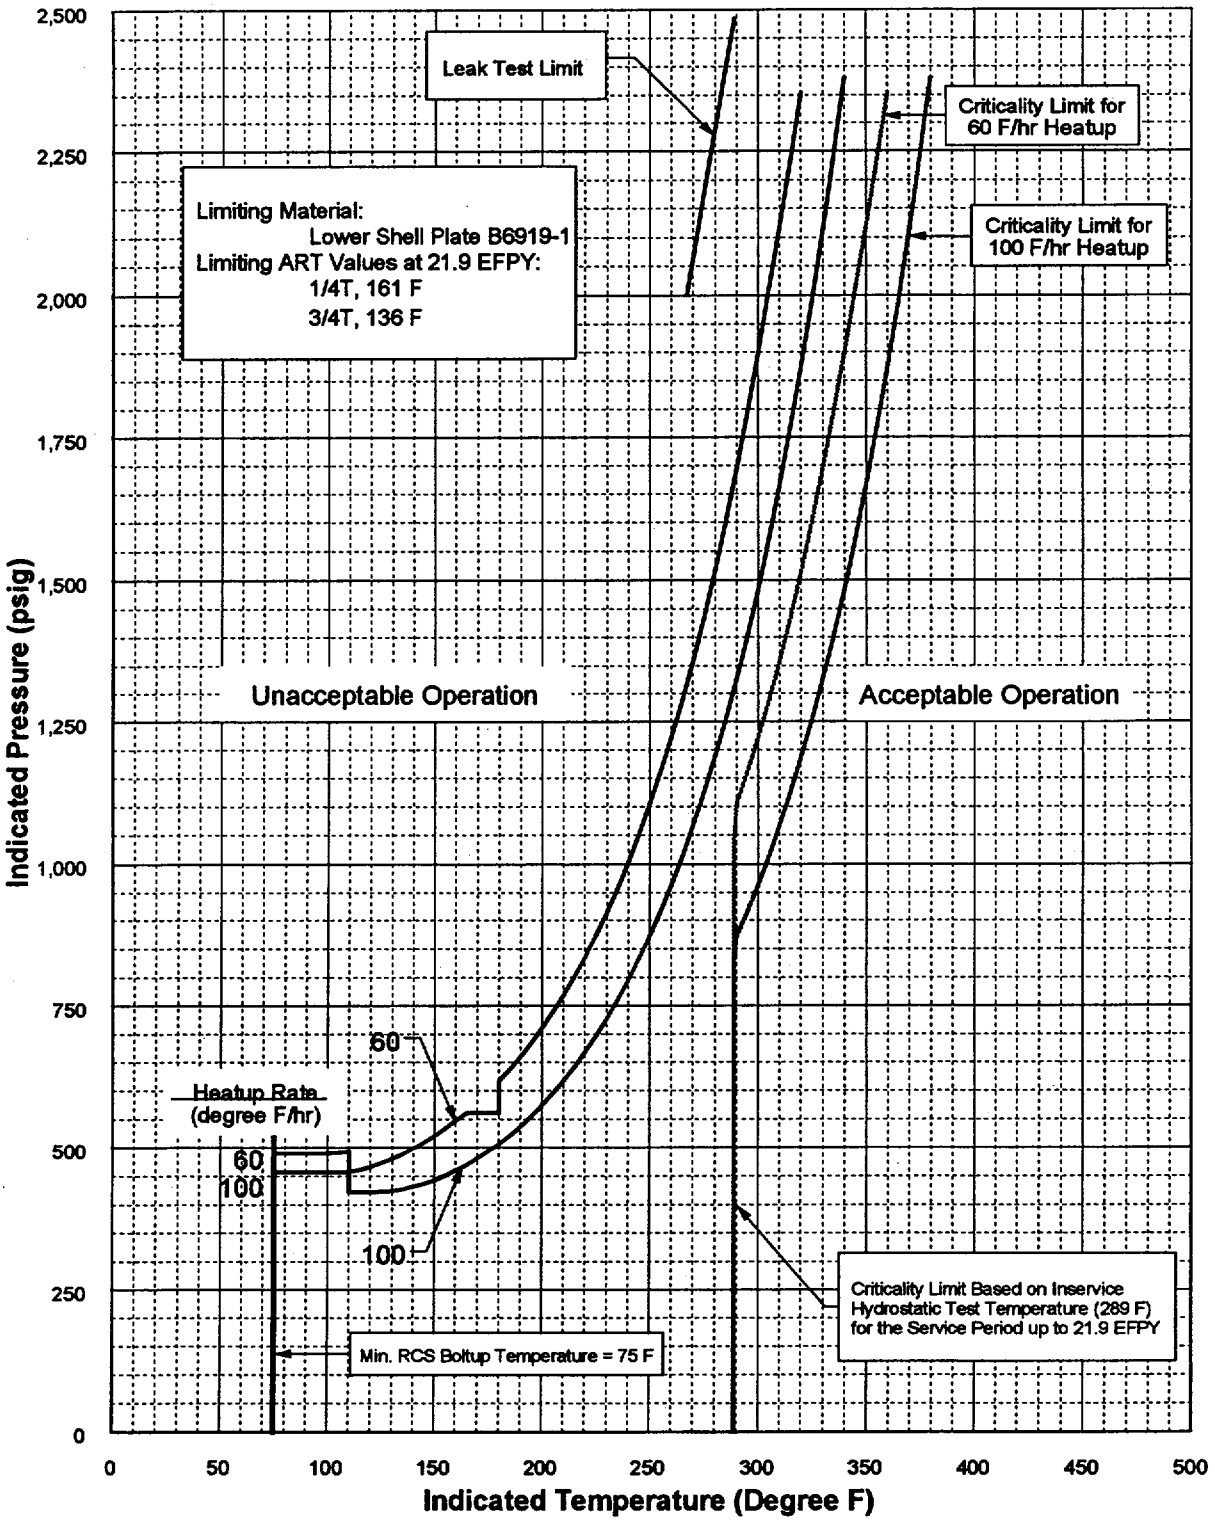

Figure 2-1

Farley Unit 1 Reactor Coolant System Heatup Limitations (Heatup Rates up to 100°F/hr) Applicable to 21.9 EFPY (adjusted to include 60 psi ΔP at RCS temperatures ≥ 110°F and 27 psi ΔP for RCS temperatures < 110°F). Includes vessel flange requirements of 180°F and 561 psig per 10 CFR 50, Appendix G. [1]

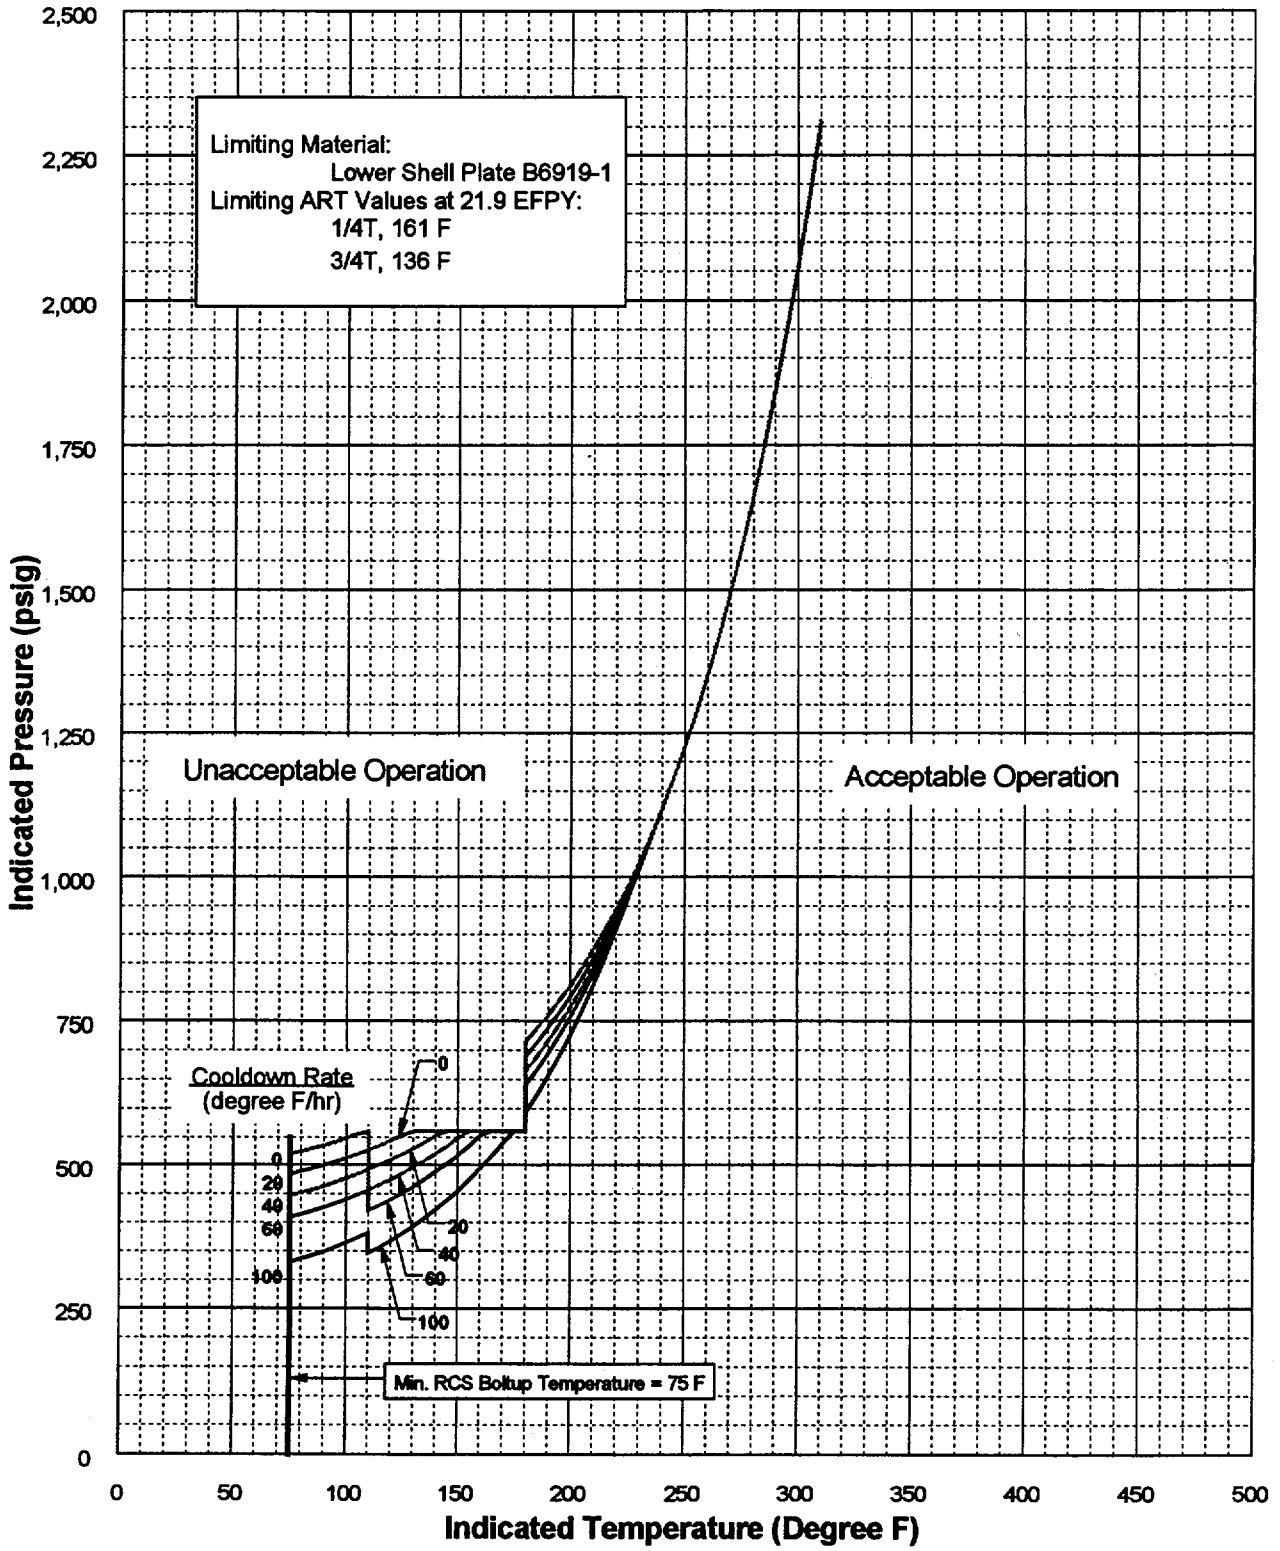

Figure 2-2

Farley Unit 1 Reactor Coolant System Cooldown Limitations (Cooldown Rates up to 100°F/hr) Applicable to 21.9 EFPY (adjusted to include 60 psi ΔP at RCS temperatures ≥ 110°F and 27 psi ΔP for RCS temperatures < 110°F). Includes vessel flange requirements of 180°F and 561 psig per 10 CFR 50, Appendix G. [1]

3.0 Reactor Vessel Material Surveillance Program

The reactor vessel material surveillance program is in compliance with 10 CFR 50, Appendix H, and is described in Section 5.4.3.6 of the Farley FSAR. The removal schedule is provided in Table 3-1. The results of these examinations shall be used to update Figures 2-1 and 2-2 if the results indicate that the adjusted reference temperature (ART) for the limiting beltline material exceeds the ART used to generate the P/T limits shown in Figures 2-1 and 2-2 for the specified fluence period.

Table 3-1

4.0 Reactor Vessel Surveillance Data Credibility

Regulatory Guide 1.99, Revision 2, describes general procedures acceptable to the NRC staff for calculating the effects of neutron radiation embrittlement of the low-alloy steels currently used for light-water-cooled reactor vessels. Position C.2 of Regulatory Guide 1.99, Revision 2, describes the methodology for calculating the adjusted reference temperature and Charpy upper-shelf energy of reactor vessel beltline materials using surveillance capsule data. The methods of Position C.2 can only be applied when two or more credible surveillance data sets become available from the reactor in question.

To date, there have been four surveillance capsules removed from the Farley Unit 1 reactor vessel. In accordance with the discussion of Regulatory Guide 1.99, Revision 2, there are five requirements that must be met for the surveillance data to be judged credible.

The purpose of this evaluation is to apply the credibility requirements of Regulatory Guide 1.99, Revision 2, to the Farley Unit 1 reactor vessel surveillance data and determine if the Farley Unit 1 surveillance data is credible.

Criterion 1: Materials in the capsules should be those judged most likely to be controlling with regard to radiation embrittlement.

The beltline region of the reactor vessel is defined in Appendix G to 10 CFR 50, Fracture Toughness Requirements, December 19, 1995, to be:

> the reactor vessel (shell material including welds, heat affected zones, and plates or forgings) that directly surrounds the effective height of the active core and adjacent regions of the reactor vessel that are predicted to experience sufficient neutron radiation damage to be considered in the selection of the most limiting material with regard to radiation damage.

The Farley Unit 1 reactor vessel consists of the following beltline region materials:

- Intermediate shell plates B6903-2 and B6903-3;
- Lower shell plates B6919-1 and B6919-2;
- Intermediate shell longitudinal weld seams 19-894 A & B, heat number 33A277, Linde 1092 flux, flux lot 3889;
- Lower shell longitudinal weld seams 20-894 A & B, heat number 90099, Linde 0091 flux, flux lot 3977; and
- Circumferential weld 11-894, heat number 6329637, Linde 0091 flux, flux lot 3999.

Per WCAP-8810[5], the Unit 1 surveillance program was based on ASTM E185-73, Standard Recommended Practice for Surveillance Tests for Nuclear Reactor Vessels. Per Section 4.1 of ASTM E185-73, the base metal and weld metal to be included in the program should represent the material that may limit the operation of the reactor during its lifetime. The test material should be selected on the basis of initial transition temperature, upper shelf energy level, and estimated increase in transition temperature considering chemical composition (copper and phosphorus) and neutron fluence.

Therefore, at the time the Farley Unit 1 surveillance capsule program was developed, lower shell plate B6919-1 was judged to be most limiting based on the above recommendations and was utilized in the surveillance program.

The surveillance program weld for Farley Unit 1 was fabricated using the same heat of weld wire used to fabricate the middle shell axial seams 19-894 A & B (heat 33A277). The results of mechanical property tests performed on the surveillance weld are considered to be representative of the property changes expected in the reactor vessel beltline seams.

Therefore, the materials selected for use in the Farley Unit 1 surveillance program were those judged to be most likely controlling with regard to radiation embrittlement according to the accepted methodology at the time the surveillance program was developed. Based on the above, the Farley Unit 1 surveillance program meets the requirements of Criterion 1.

Criterion 2: Scatter in the plots of Charpy energy versus temperature for the irradiated and unirradiated conditions should be small enough to permit the determination of the 30 ft-lb temperature and upper shelf energy, unambiguously.

Plots of Charpy energy versus temperature for the unirradiated condition are presented in the Unit 1 reactor vessel surveillance program description contained in WCAP-8810[5].

Plots of Charpy energy versus temperature for the irradiated conditions are presented in the reactor vessel surveillance capsule reports for capsules Y[6], U[7], X[8], and W[2].

Based on engineering judgment, the scatter in the data presented in these plots is small enough to determine the 30 ft-lb temperature and upper shelf energy of the Farley Unit 1 surveillance materials unambiguously. Therefore, the Farley Unit 1 surveillance program meets the requirements of Criterion 2.

Criterion 3: When there are two or more sets of surveillance data from one reactor, the scatter of ΔRT_{NDT} values about a best-fit line drawn as described in Regulatory Position 2.1 normally should be less than 28°F for welds and 17°F for base metal. Even if the fluence range is large (two or more orders of magnitude), the scatter should not exceed twice those values. Even if the data fail this criterion for use in shift calculations, they may be credible for determining decrease in upper shelf energy if the upper shelf can be clearly determined, following the definition given in ASTM E185-82.

The least squares method, as described in Regulatory Position 2.1, will be utilized in determining a best-fit line for this data to determine if this criterion is met.

[Continued on the following page]

Table 4-1

SURVEILLANCE CAPSULE DATA CALCULATION OF BEST-FIT LINE AS DESCRIBED IN POSITION 2.1 OF REGULATORY GUIDE 1.99, REVISION 2 [a]

Material	Capsule	F [b]	FF [c] (x)	ΔRT_{NDT} (y)	FF x ΔRT_{NDT} (xy)	FF^2 (x^2)

	U	1.81	1.16	90	104.4	1.35
	X	3.24	1.31	105	137.6	1.72
	W	5.17	1.41	145	204.5	1.99
				$\sum_{i=1}^{n}$	1086.5	11.65
	$CF = \Sigma(FF * \Delta RT_{NDT}) \div \Sigma(FF^2) = 93.3°F$					
Weld Metal	Y	0.642	0.876	80	70.1	0.767
	U	1.81	1.16	80	92.8	1.35
	X	3.24	1.31	100	131.0	1.72
	W	5.17	1.41	95	134.0	1.99
				$\sum_{i=1}^{n}$	427.9	5.83
	$CF = \Sigma(FF * \Delta RT_{NDT}) \div \Sigma(FF^2) = 73.4°F$					

NOTES:
(a) WCAP-14689, Revision 4 [1]
(b) F = Fluence (10^{19} n/cm^2, E > 1.0 MeV)
(c) FF = Fluence Factor = $F^{(0.28 - 0.1 \log f)}$

Table 4-2

SCATTER OF ΔRT_{NDT} VALUES ABOUT A BEST-FIT LINE FOR SURVEILLANCE PLATE MATERIAL [a]

Lower Shell Plate B6919-1 Orientation	FF	ΔRT_{NDT} (30 ft-lb) (°F)	Best Fit ΔRT_{NDT} (°F)	Scatter of ΔRT_{NDT} (°F)
Longitudinal	0.876	85	81.7	-3.3
	1.16	105	108.2	3.2
	1.31	135	122.2	-12.8
	1.41	155	131.6	-23.4
Transverse	0.876	55	81.7	26.7
	1.16	90	108.2	18.2
	1.31	105	122.2	17.2
	1.41	145	131.6	-13.4

NOTES:
(a) WCAP-14689, Revision 4 [1]

The scatter of ΔRT_{NDT} values about a best-fit line drawn with the y-intercept equal to zero, as described in Regulatory Position 2.1, should be less than 17°F for base metal. As shown above, the scatter of four of the data points are not within 17°F of the best-fit line. Therefore, this criteria is not met for the Farley Unit 1 surveillance plate material. Since all of the data is not within 17°F of the best fit line, SNC has chosen to use the CF from this surveillance data along with a σ_Δ of 17°F when predicting the Farley Unit 1 vessel properties.

Table 4-3

SCATTER OF ΔRT_{NDT} VALUES ABOUT A BEST-FIT LINE FOR SURVEILLANCE WELD MATERIAL [a]

Material	FF	ΔRT_{NDT} (30 ft-lb) (°F)	Best Fit ΔRT_{NDT} (°F)	Scatter of ΔRT_{NDT} (°F)
Weld Metal	0.876	80	64.3	-15.7
	1.16	80	85.1	5.1
	1.31	100	96.2	-3.8
	1.41	95	103.5	8.5

NOTES:
(a) WCAP-14689, Revision 4 [1]

The scatter of ΔRT_{NDT} values about a best-fit line drawn with the y-intercept equal to zero, as described in Regulatory Position 2.1, is less than 28°F as shown above. Therefore, Criterion 3 is met for the Farley Unit 1 surveillance weld material.

Criterion 4: The irradiation temperature of the Charpy specimens in the capsule should match the vessel wall temperature at the cladding/base metal interface within ±25°F.

The Farley Unit 1 capsule specimens are located in the reactor between the neutron shielding pads and the vessel wall and are positioned opposite the center of the core. The test capsules are in guide tubes attached to the neutron shielding pads. The location of the specimens with respect to the reactor vessel beltline provides assurance that the reactor vessel wall and the specimens experience equivalent operating conditions and will not differ by more than 25°F. Therefore, the Farley surveillance program meets the requirements of Criterion 4.

Criterion 5: The surveillance data for the correlation monitor material in the capsule should fall within the scatter band of the data base for that material.

The Farley Unit 1 surveillance program does not include correlation monitor material. Therefore, Criterion 5 is not applicable to Farley Unit 1.

CONCLUSION:
Based on the preceding responses to the criteria of Regulatory Guide 1.99, Revision 2, Section B, and the application of engineering judgment, the Farley Unit 1 surveillance plate material data is not credible and the Farley Unit 1 surveillance weld data is credible.

5.0 Supplemental Data Tables

Table 5-1 contains a comparison of measured surveillance material 30 ft-lb transition temperature shifts and upper shelf energy decreases with Regulatory Guide 1.99, Revision 2, predictions.

Table 5-2 shows the calculation of the surveillance material chemistry factors using surveillance capsule data.

Table 5-3 provides the unirradiated Farley Unit 1 reactor vessel toughness data.

Table 5-4 provides a summary of the fluences used in the PTS evaluation.

Table 5-5 provides a summary of the adjusted reference temperatures (ARTs) of the Farley Unit 1 reactor vessel beltline materials at the 1/4-T and 3/4-T locations for 21.9 EFPY.

Table 5-6 shows the calculation of the ART at 21.9 EFPY for the limiting Farley Unit 1 reactor vessel material (lower shell plate B6919-1).

Table 5-7 provides RT_{PTS} values for Farley Unit 1 for 36 EFPY.

(a) WCAP-14689, Revision 4 [1]
(b) Fluence in 10^{19} n/cm^2 (E > 1.0 MeV)
(c) Indicates location in octants with a 26° neutron pad span.

Table 5-5

SUMMARY OF ADJUSTED REFERENCE TEMPERATURES (ARTs) FOR REACTOR VESSEL BELTLINE MATERIALS AT THE 1/4-T AND 3/4-T LOCATIONS FOR 21.9 EFPY [a, b]

Material	1/4-T (°F)	3/4-T (°F)
Intermediate Shell Plate B6903-2	138	114
Intermediate Shell Plate B6903-3	138	115
Lower Shell Plate B6919-1	161 [c]	135 [c]
Lower Shell Plate B6919-1 Using S/C Data	156	131
Lower Shell Plate B6919-2	151	126
Intermediate Shell Longitudinal Weld Seams 19-894 A & B (Heat # 33A277)	113 [d]	82 [d]
Intermediate Shell Longitudinal Weld Seams 19-894 A & B (Heat # 33A277) Using S/C Data	85 [d]	56 [d]
Circumferential Weld 11-894 (Heat # 6329637)	123	97
Lower Shell Longitudinal Weld Seams 20-894 A & B (Heat # 90099)	85 [d]	62 [d]

NOTES:

(a) WCAP-14689, Revision 4 [1]

(b) The ARTs presented here are based on the peak reactor vessel surface fluence of 2.718×10^{19} n/cm^2 (E > 1.0 MeV) unless otherwise noted.

(c) Limiting 1/4-T and 3/4-T ART values. The P/T limit curves are those previously generated based on a 1/4T ART of 161°F and a 3/4-T ART value of 136°F which bounds the limiting 1/4-T and 3/4-T ARTs shown above.

(d) ARTs calculated using the peak vessel fluence of 0.8307×10^{19} n/cm^2 (E > 1.0 MeV) at 45°

Table 5-6

CALCULATION OF ADJUSTED REFERENCE TEMPERATURE AT 21.9 EFPY FOR THE LIMITING REACTOR VESSEL MATERIAL - LOWER SHELL PLATE B6919-1 [a]

Parameter		
Operating Period	21.9 EFPY	
Location	1/4-T	3/4-T
Chemistry Factor, CF (°F)	97.8	97.8
Fluence, f (10^{19} n/cm^2) [b]	1.695	0.659
Fluence Factor, FF	1.145	0.883
ΔRT_{NDT} = CF x FF (°F)	112.0	86.4
Initial RT_{NDT}, I (°F)	15	15
Margin, M (°F)	34	34
Adjusted Reference Temperature (ART), (°F) per Regulatory Guide 1.99, Revision 2	161	135

NOTES:
(a) WCAP-14689, Revision 4 [1]
(b) Fluence is based on f_{surf} (10^{19} n/cm^2, E > 1.0 MeV) = 2.718 at 21.9 EFPY. The Farley Unit 1 reactor vessel wall thickness is 7.875 inches in the beltline region.

Table 5-7

PRESSURIZED THERMAL SHOCK (RT_{PTS}) VALUES FOR 36 EFPY [a]

Material	CF	Surface Fluence (10^{19} n/cm^2, E > 1.0 MeV)	FF	ΔRT_{NDT} (CF x FF) (°F)	I (°F)	M (°F)	RT_{PTS} (°F)
Intermediate Shell Plate B6903-2	91.0	4.34	1.374	125.0	0	34	159
Intermediate Shell Plate B6903-3	82.2	4.34	1.374	112.9	10	34	157
Lower Shell Plate B6919-1	97.8	4.34	1.374	134.4	15	34	183
Lower Shell Plate B6919-1 Using S/C Data	93.3	4.34	1.374	128.2	15	34 [b]	177
Lower Shell Plate B6919-2	98.2	4.34	1.374	134.9	5	34	174
Intermediate Shell Longitudinal Welds 19-894 A & B (Heat # 33A277)	126.2	1.35	1.083	136.7	-56	66	147
Intermediate Shell Longitudinal Welds 19-894 A & B (Heat # 33A277) Using S/C Data	118.9	1.35	1.083	128.8	-56	44	117
Circumferential Weld 11-894 (Heat # 6329637)	98.4	4.34	1.374	135.2	-56	66	145
Lower Shell Longitudinal Welds 20-894 A & B (Heat # 90099)	91.4	1.35	1.083	99.0	-56	66	109

NOTES:
(a) WCAP-14689, Revision 4 [1]
(b) σ_Δ = 17°F since the plate surveillance data did not meet credibility criteria

1.0 RCS Pressure Temperature Limits Report (PTLR)

This PTLR for Farley Nuclear Plant - Unit 2 has been prepared in accordance with the requirement of Technical Specification (TS) 5.6.6. Revisions to the PTLR shall be provided to the NRC after issuance.

This report affects TS 3.4.3, RCS Pressure/Temperature Limits (P/T) Limits. All TS requirements associated with low temperature overpressure protection (LTOP) are contained in TS 3.4.12, RCS Overpressure Protection Systems.

2.0 Operating Limits

The limits for TS 3.4.3 are presented in the subsection which follows and were developed using the NRC-approved methodologies specified in TS 5.6.6. The operability requirements associated with LTOP are specified in TS LCO 3.4.12 and were determined to adequately protect the RCS against brittle fracture in the event of an LTOP transient in accordance with the methodology specified in TS 5.6.6. The limitation on the number of operating reactor coolant pumps (RCPs) is necessary to assure operation consistent with the pressure corrections incorporated in the P/T limits for flow losses associated with the RCPs.

2.1 RCS Pressure/Temperature (P/T) Limits (LCO - 3.4.3)

2.1.1 The minimum boltup temperature is 75°F.

2.1.2 The RCS temperature rate-of-change limits are:

a. A maximum heatup of 100°F in any one hour period.
b. A maximum cooldown of 100°F in any one hour period.
c. A maximum temperature change of less than or equal to 10°F in any one hour period during inservice hydrostatic and leak testing operations above the heatup and cooldown limit curves.

2.1.3 The RCS P/T limits for heatup and cooldown are specified by Figures 2-1 and 2-2, respectively.

2.2 RCP Operation Limits

2.2.1 The number of operating RCPs is limited to one at RCS temperatures less than 110°F with the exception that a second pump may be started for the purpose of maintaining continuous flow while taking the operating pump out of service.

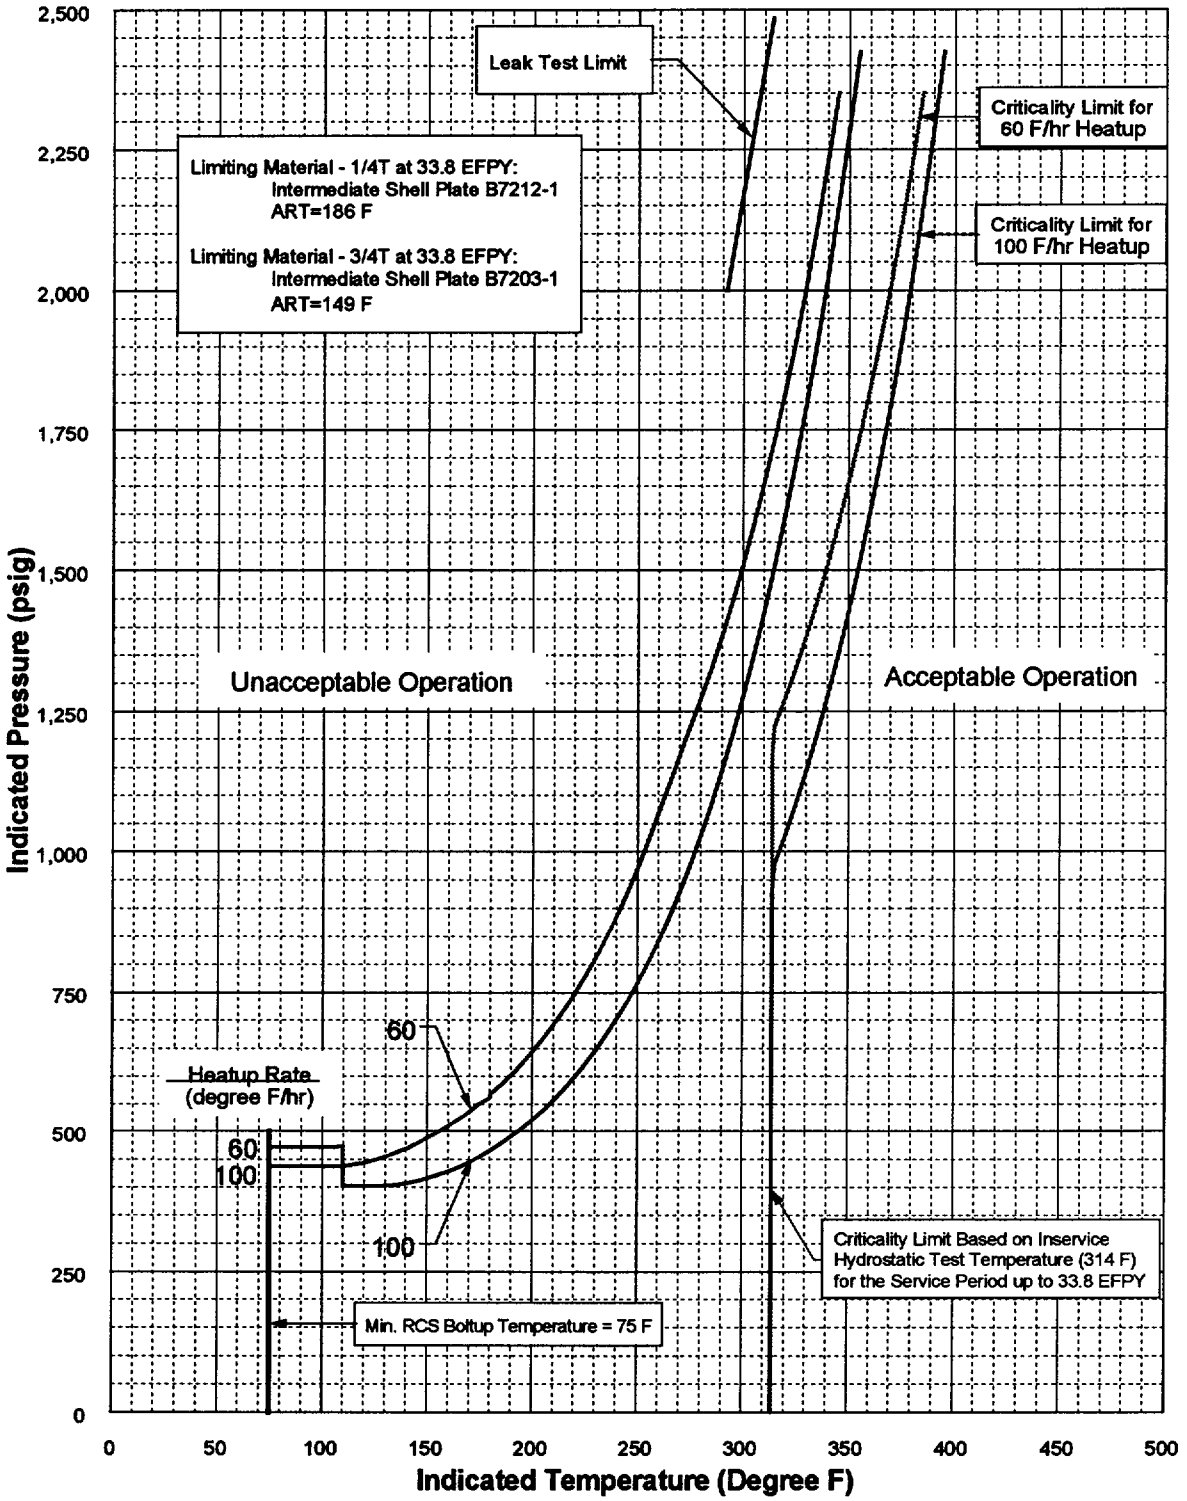

Figure 2-1

Farley Unit 2 Reactor Coolant System Heatup Limitations (Heatup Rates up to 100°F/hr) Applicable to 33.8 EFPY (adjusted to include 60 psi ΔP at RCS temperatures ≥ 110°F and 27 psi ΔP at RCS temperatures < 110°F). Includes vessel flange requirements of 180°F and 561 psig per 10 CFR 50, Appendix G. [1]

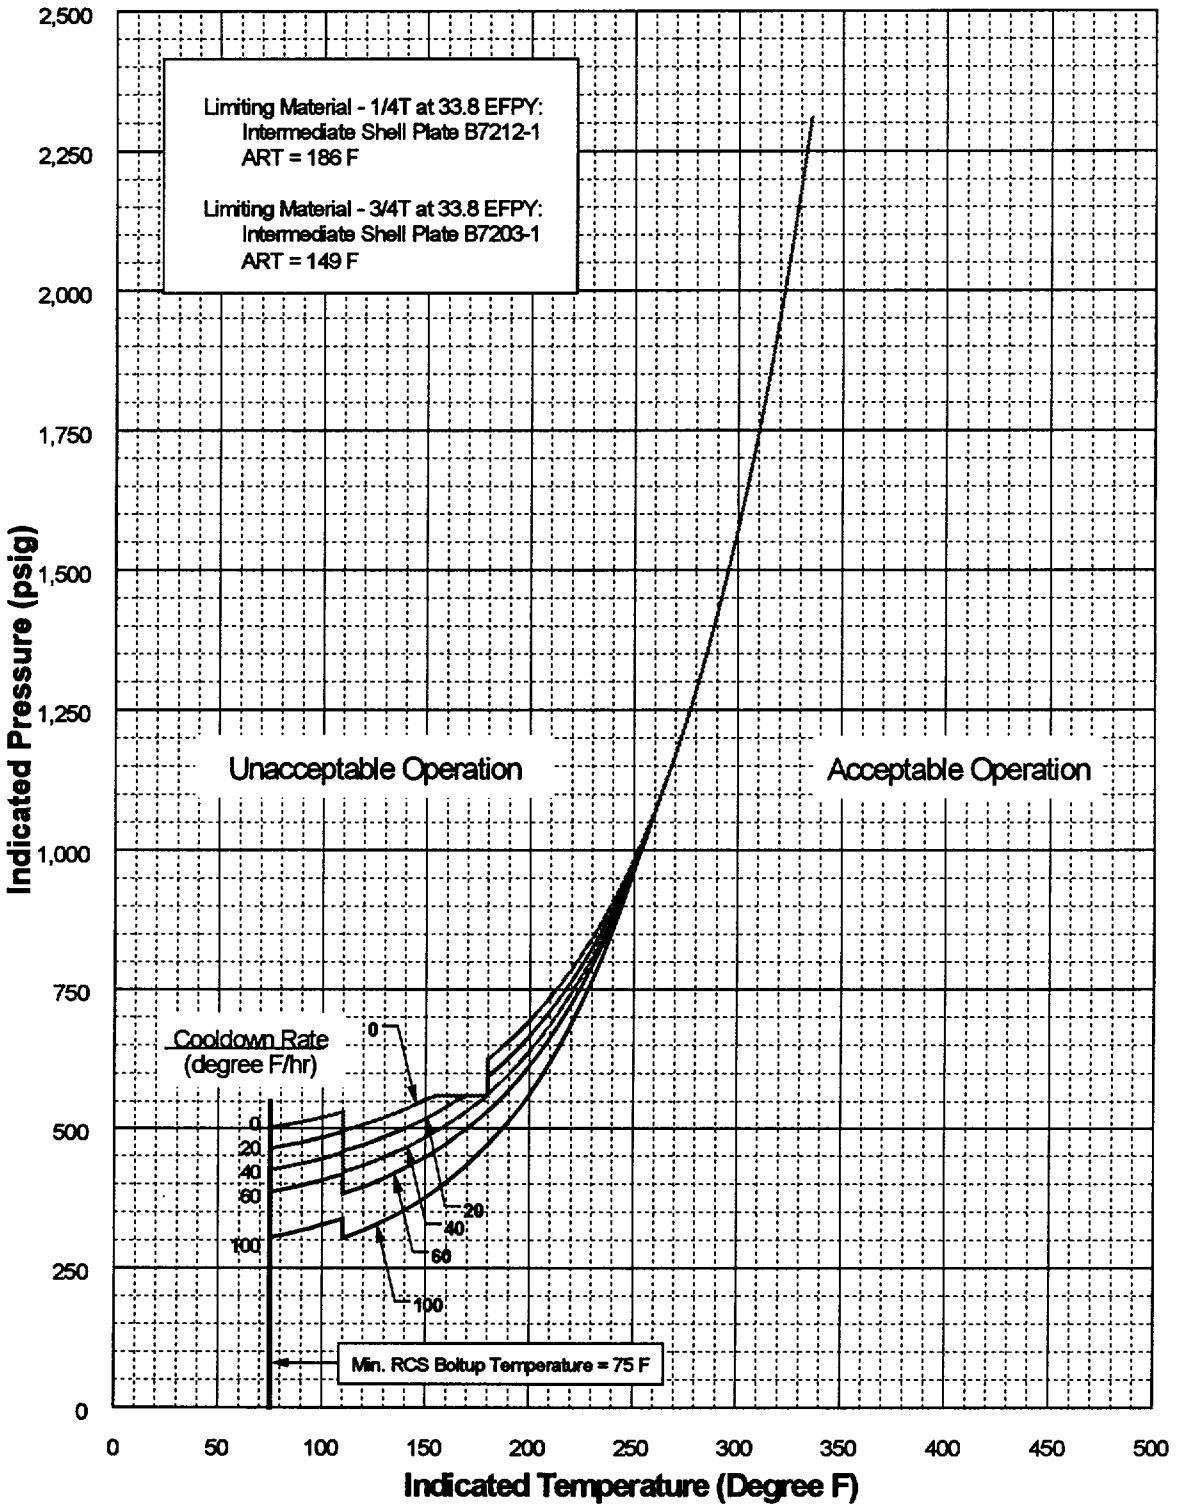

Figure 2-2

Farley Unit 2 Reactor Coolant System Cooldown Limitations (Cooldown Rates up to 100°F/hr) Applicable to 33.8 EFPY (adjusted to include 60 psi ΔP at RCS temperatures ≥ 110°F and 27 psi ΔP at RCS temperatures < 110°F). Includes vessel flange requirements of 180°F and 561 psig per 10 CFR 50, Appendix G. [1]

3.0 Reactor Vessel Material Surveillance Program

The reactor vessel material surveillance program is in compliance with 10 CFR 50, Appendix H, and is described in Section 5.4.3.6 of the Farley FSAR. The removal schedule is provided in Table 3-1. Consistent with specific requirements for Farley Unit 2 associated with the granting of an exemption to Appendix H of 10 CFR 50 documented in NUREG-0117 [4], Figures 2-1 and 2-2 are based on the greater, or limiting value, of the following: (1) the actual shift in reference temperature for plate B7212-1 as determined by impact testing, or (2) the predicted shift in reference temperature for weld seam 11-923 as determined by Regulatory Guide 1.99, Revision 2. Results from the reactor vessel surveillance program will be used to update Figures 2-1 and 2-2 if the results indicate that the adjusted reference temperature (ART) for the limiting beltline material exceeds the ART used to generate the P/T limits shown in Figures 2-1 and 2-2 for the specified fluence period.

Table 3-1

4.0 Reactor Vessel Surveillance Data Credibility

Regulatory Guide 1.99, Revision 2, describes general procedures acceptable to the NRC staff for calculating the effects of neutron radiation embrittlement of the low-alloy steels currently used for light-water-cooled reactor vessels. Position C.2 of Regulatory Guide 1.99, Revision 2, describes the methodology for calculating the adjusted reference temperature and Charpy upper-shelf energy of reactor vessel beltline materials using surveillance capsule data. The methods of Position C.2 can only be applied when two or more credible surveillance data sets become available from the reactor in question.

To date, there have been three capsules removed from the Farley Unit 2 vessel. In accordance with the discussion of Regulatory Guide 1.99, Revision 2, there are five requirements that must be met for the surveillance data to be judged credible.

The purpose of this evaluation is to apply the credibility requirements of Regulatory Guide 1.99, Revision 2, to the Farley Unit 2 reactor vessel surveillance data and determine if the Farley Unit 2 surveillance data is credible.

Criterion 1: Materials in the capsules should be those judged most likely to be controlling with regard to radiation embrittlement.

The beltline region of the reactor vessel is defined in Appendix G to 10 CFR 50, Fracture Toughness Requirements, December 19, 1995, to be:

> the reactor vessel (shell material including welds, heat affected zones, and plates or forgings) that directly surrounds the effective height of the active core and adjacent regions of the reactor vessel that are predicted to experience sufficient neutron radiation damage to be considered in the selection of the most limiting material with regard to radiation damage.

The Farley Unit 2 reactor vessel consists of the following beltline region materials:

- Intermediate shell plates B7203-1 and B7212-1;
- Lower shell plates B7210-1 and B7210-2;
- Intermediate shell longitudinal weld seams 19-923 A, heat number HODA;
- Intermediate shell longitudinal weld seams 19-923 B, heat number BOLA;
- Lower shell longitudinal weld seams 20-923 A & B, heat number 83640, Linde 0091 flux, flux lot 3490; and
- Circumferential weld 11-923, heat number 5P5622, Linde 0091 flux, flux lot 1122.

Per WCAP-8956[5], the Farley Unit 2 surveillance program was based on ASTM E185-73, Standard Recommended Practice for Surveillance Tests for Nuclear Reactor Vessels. Per Section 4.1 of ASTM E185-73, the base metal and weld metal to be included in the program should represent the material that may limit the operation of the reactor during its lifetime. The test material should be selected on the basis of initial transition temperature, upper shelf energy level, and estimated increase in transition temperature considering chemical composition (copper and phosphorus) and neutron fluence.

At the time the Farley Unit 2 surveillance capsule program was developed, intermediate shell plate B7212-1 was judged to be most limiting and was therefore, utilized in the surveillance program.

The surveillance program weld for Farley Unit 2 was fabricated using the shielded metal arc welding process and E8018 stick electrodes, in a manner similar to that used to fabricate intermediate shell longitudinal seams 19-923 A (heat HODA) and B (heat BOLA). These electrodes were not copper-coated and do not exhibit the chemical variability found in copper-coated submerged arc weld wire. Although the surveillance weld material does not represent the limiting reactor vessel beltline weld, the results of mechanical property tests performed on the surveillance weld are considered to be representative of the property changes expected in the reactor vessel beltline seams. The NRC explicitly approved the selection of the Farley Unit 2 surveillance weld material on the basis that the limiting beltline material (i.e., intermediate plate B7212-1) was included in the surveillance program and conservative methods of analysis contained in Regulatory Guide 1.99 were available to predict the radiation characteristics of the limiting beltline weld. The NRC incorporated an exemption to the requirements of Appendix H to 10 CFR Part 50 in the Farley Unit 2 Operating License, thereby approving the selected surveillance weld material based on the NRC evaluation provided in Section 5.2.1 of NUREG-0117. [4]

Although the Farley Unit 2 surveillance weld material does not meet the requirements of Criterion 1, conservative methods of analysis are available to predict the radiation characteristics of the limiting beltline weld. The limiting beltline plate material is intermediate plate B7212-1 which is more limiting than any of the reactor vessel beltline welds and is included in the reactor vessel material surveillance program. Therefore, the Farley Unit 2 reactor vessel material surveillance program provides assurance that the radiation damage to the vessel can be adequately determined and the integrity of the Farley Unit 2 reactor vessel will be ensured during normal plant operations and anticipated operational occurrences. Therefore, the Farley Unit 2 reactor vessel surveillance program meets the intent of Criterion 1.

Criterion 2: Scatter in the plots of Charpy energy versus temperature for the irradiated and unirradiated conditions should be small enough to permit the determination of the 30 ft-lb temperature and upper shelf energy, unambiguously.

Plots of Charpy energy versus temperature for the unirradiated condition are presented in WCAP-8956 [5], Alabama Power Company Joseph M. Farley Nuclear Plant Unit No. 2 Reactor Vessel Radiation Surveillance Program, dated August 1977.

Plots of Charpy energy versus temperature for the irradiated conditions are presented in the reactor vessel surveillance capsule reports for Capsules U [6], W [7], and X [2].

Based on engineering judgment, the scatter in the data presented in these plots is small enough to determine the 30 ft-lb temperature and upper shelf energy of the Farley Unit 2 surveillance materials unambiguously. Therefore, the Farley Unit 2 surveillance program meets the requirements of Criterion 2.

Criterion 3: When there are two or more sets of surveillance data from one reactor, the scatter of ΔRT_{NDT} values about a best-fit line drawn as described in Regulatory Position 2.1 normally should be less than 28°F for welds and 17°F for base metal. Even if the fluence range is large (two or more orders of magnitude), the scatter should not exceed twice those values. Even if the data fail this criterion for use in shift calculations, they may be credible for determining decrease in upper shelf energy if the upper shelf can be clearly determined, following the definition given in ASTM E185-82.

The least squares method, as described in Regulatory Position 2.1 will be utilized in determining a best-fit line for this data to determine if this criterion is met.

[Continued on following page]

TABLE 4-1

SURVEILLANCE CAPSULE DATA CALCULATION OF BEST-FIT LINE AS DESCRIBED IN POSITION 2.1 OF REGULATORY GUIDE 1.99, REVISION 2 [a]

	W	1.85	1.17	165	193.1	1.37
	X	3.18	1.30	190	247.0	1.69
				$\sum_{i=1}^{n}$	1073.4	7.65
	$CF = \Sigma(FF * \Delta RT_{NDT}) \div \Sigma(FF^2) = 140.3$ °F					
Weld Metal	U	0.639	0.874	10	8.74	0.764
	W	1.85	1.17	10	11.7	1.37
	X	3.18	1.30	10	13.0	1.69
				$\sum_{i=1}^{n}$	33.4	3.82
	$CF = \Sigma(FF * \Delta RT_{NDT}) \div \Sigma(FF^2) = 8.7$ °F					

NOTES:
(a) WCAP-14689, Revision 4 [1]
(b) F = Fluence (10^{19} n/cm^2, E > 1.0 MeV)
(c) FF = Fluence Factor = $F^{(0.28 - 0.1 \log f)}$

TABLE 4-2
SCATTER OF ΔRT_{NDT} VALUES ABOUT A BEST-FIT LINE
FOR SURVEILLANCE PLATE MATERIAL [a]

Intermediate Shell Plate B7212-1 Orientation	FF	ΔRT_{NDT} (30 ft-lb) (°F)	Best Fit ΔRT_{NDT} (°F)	Scatter of ΔRT_{NDT} (°F)
Longitudinal	0.874	103	122.6	19.6
	1.17	165	164.2	-0.8
	1.30	180	182.4	2.4
Transverse	0.874	133	122.6	-10.4
	1.17	165	164.2	-0.8
	1.30	190	182.4	-7.6

NOTES:
(a) WCAP-14689, Revision 4 [1]

The scatter of ΔRT_{NDT} values about a best-fit line drawn with the y-intercept equal to zero, as described in Regulatory Position 2.1, should be less than one σ (17°F) for base metal. From a statistical point of view, $\pm$ one σ (17°F) should encompass approximately 68% of the data and one would expect at least one data point to be outside the $\pm$ one σ limits. As shown above, the scatter is within 17°F of the best-fit line for all data points except one. The one point that is not within the scatter is 19.6°F below the best-fit line (i.e., the best-fit line over predicts this data point). Based on the above discussion and engineering judgment, the Farley Unit 2 surveillance program conservatively predicts the material properties changes for the beltline plate. Therefore, the intent of Criterion 3 is met for the Farley Unit 2 surveillance plate material.

TABLE 4-3
SCATTER OF ΔRT_{NDT} VALUES ABOUT A BEST-FIT LINE
FOR SURVEILLANCE WELD MATERIAL [a]

Material	FF	ΔRT_{NDT} (30 ft-lb) (°F)	Best Fit ΔRT_{NDT} (°F)	Scatter of ΔRT_{NDT} (°F)
Weld Metal	0.874	10	7.6	-2.4
	1.17	10	10.2	0.2
	1.30	10	11.3	1.3

NOTES:
(a) WCAP-14689, Revision 4 [1]

The scatter of ΔRT_{NDT} values about a best-fit line drawn with the y-intercept equal to zero, as described in Regulatory Position 2.1, is less than 28°F as shown above. Therefore, Criterion 3 is met for the Farley Unit 2 surveillance weld material.

Criterion 4: The irradiation temperature of the Charpy specimens in the capsule should match the vessel wall temperature at the cladding/base metal interface within ±25°F.

The Farley Unit 2 capsule specimens are located in the reactor between the neutron shielding pads and the vessel wall and are positioned opposite the center of the core. The test capsules are in guide tubes attached to the neutron shielding pads. The location of the specimens with respect to the reactor vessel beltline provides assurance that the reactor vessel wall and the specimens experience equivalent operating conditions and will not differ by more than 25°F. Therefore, the Farley reactor vessel surveillance program meets the requirements of Criterion 4.

Criterion 5: The surveillance data for the correlation monitor material in the capsule should fall within the scatter band of the data base for that material.

The Farley Unit 2 surveillance program does not include correlation monitor material. Therefore, this criterion is not applicable to Farley Unit 2.

CONCLUSION:
Based on the preceding responses to the criteria of Regulatory Guide 1.99, Revision 2, Section B, and the application of engineering judgment, the Farley Unit 2 surveillance data is credible.

5.0 Supplemental Data Tables

Table 5-1 contains a comparison of measured surveillance material 30 ft-lb transition temperature shifts and upper shelf energy decreases with Regulatory Guide 1.99, Revision 2, predictions.

Table 5-2 shows the calculation of the surveillance material chemistry factors using surveillance capsule data.

Table 5-3 provides the unirradiated Farley Unit 2 reactor vessel toughness data.

Table 5-4 provides a summary of the fluences used in the PTS evaluation.

Table 5-5 provides a summary of the adjusted reference temperatures (ARTs) of the Farley Unit 2 reactor vessel beltline materials at the 1/4-T and 3/4-T locations for 33.8 EFPY.

Table 5-6 shows the calculation of the ART at 33.8 EFPY for the limiting Farley Unit 2 reactor vessel material.

Table 5-7 provides RT_{PTS} values for Farley Unit 2 for 36 EFPY.

NOTES:

(a) WCAP-14689, Revision 4 [1]

(b) Fluence is based on f_{surf} (10^{19} n/cm^2, E > 1.0 MeV) = 4.127 at 33.8 EFPY. The Farley Unit 2 reactor vessel wall thickness is 7.875 inches in the beltline region.

(c) Margin is calculated as $M = 2(\sigma_i^2 + \sigma_\Delta^2)^{0.5}$. The standard deviation for the initial RT_{NDT} margin term, σ_i, is 0°F since the initial RT_{NDT} is a measured value. The standard deviation for the ΔRT_{NDT} term, σ_Δ, is 17°F for the plate, except that σ_Δ need not exceed 0.5 times the mean value of ΔRT_{NDT}. In accordance with Regulatory Guide 1.99, Revision 2, Position 2.1, values of σ_Δ may be cut in half when based on credible surveillance data.

Table 5-7

PRESSURIZED THERMAL SHOCK (RT_{PTS}) VALUES FOR 36 EFPY [a]

Material	CF	Surface Fluence (10^{19} n/cm^2, E > 1.0 MeV)	FF	ΔRT_{NDT} (CF x FF) (°F)	I (°F)	M (°F)	RT_{PTS} (°F)
Intermediate Shell Plate B7203-1	100.0	4.39	1.38	138.0	15	34	187
Intermediate Shell Plate B7212-1	149.0	4.39	1.38	205.6	-10	34	230
Intermediate Shell Plate B7212-1 Using S/C Data	140.3	4.39	1.38	193.6	-10	17	201
Lower Shell Plate B7210-1	89.8	4.39	1.38	123.9	18	34	176
Lower Shell Plate B7210-2	98.7	4.39	1.38	136.2	10	34	180
Intermediate Shell Longitudinal Welds 19-923 A (Heat # HODA)	36.8	1.40	1.09	40.1	-56	52.6	37
Intermediate Shell Longitudinal Welds 19-923 B (Heat # BOLA)	36.8	1.40	1.09	40.1	-60	40.1	20
Intermediate Shell Longitudinal Welds 19-923 B (Heat # BOLA) Using S/C Data	8.4	1.40	1.09	9.2	-60	9.2	-42
Circumferential Weld 11-923 (Heat # 5P5622)	74.1	4.39	1.38	102.3	-40	56	118
Lower Shell Longitudinal Welds 20-923 A & B (Heat # 83640)	37.3	1.40	1.09	40.7	-70	40.7	11
