Radiologic Health Branch
Mail Stop 7610
1500 Capitol
Sacramento, CA 95814-0208

Subject: Radioactive Materials License No. 0145-37: Request to Release a Certain Portion of General Atomics' Facility to Unrestricted Use and Delete it from License 0145-37: Namely, GA's "Section C of the Building 2 Service Corridor"

Dear Mr. Baker and Dr. Rogus:

As you are aware, General Atomics (GA) is continuing its efforts directed at obtaining the release to unrestricted use of selected facilities and land areas at General Atomics. GA has recently completed the final radiological surveys of Section C of the Service Corridor of its Building 2 (Science Laboratories Building), located on GA's Main Site.

GA's Building 2 contains approximately 142 laboratories, plus offices, hallways, and a service corridor which houses the utilities, heating, and A/C, etc. for the labs and offices. During the past ~ 50 years, the laboratories were used primarily for research and development activities involving the use of radioactive material.

All of the laboratories within Building 2 have been released to unrestricted use by the U.S. Nuclear Regulatory Commission (NRC) and all but a few have also been released by the State of California DHS Radiologic Health Branch (State). None of the laboratories in Building 2, or the projects occupying them, are authorized to use or store radioactive material in the service corridor, nor is such authorization anticipated in the future.

Building 2 is comprised of three arc-shaped sections which together form a "C"-shaped semi-circular building. The three sections are referred to as Sections A, B and C. Due to the large size and complexity of Building 2, the service corridor in each of the three sections is the subject of a separate release request. GA has previously requested the release of Sections A and B (References 1 and 2, respectively). This release request addresses the service corridor in **Section C**.

The service corridor in Section C occupies a total of approximately 9,496 ft² (~877 m²), which includes three levels and a number of side rooms and ventilation rooms connected to, and accessible from, the service corridor. In the past, contaminated equipment and radioactive materials or waste were, on occasion, temporarily stored in portions of the service corridor, resulting in low levels of radioactive contamination in certain localized areas.

The results of analyses of characterization samples indicated U-235, U-238, and Cs-137 were the contaminants. Appropriate decontamination activities were conducted in Section C until residual radiation levels were well below the approved release criteria specified in GA's NRC- and State-approved Site Decommissioning Plan.

The enclosed report documents the results of GA's comprehensive radiological measurements and surveys conducted within Section C of the Building 2 Service Corridor. The results of these surveys demonstrate that the service corridor in "Section C" meets the NRC- and State- approved criteria for release to unrestricted use.

Accordingly, GA hereby requests the NRC and the State to release the Service Corridor in Section C of GA's Building 2, as described in the enclosed report, to unrestricted use and to delete it from GA's NRC and State special nuclear material and radioactive material licenses, respectively.

Consistent with decisions made during joint NRC, State, and GA decommissioning coordination meetings, the NRC has the regulatory lead for the release of the Building 2 Service Corridor to unrestricted use. Moreover, in response to a request by GA, the NRC has already performed confirmatory surveys in Section C of the Building 2 Service Corridor on the basis of a "substantial" draft final survey report.

If you should have any questions regarding this request, or the enclosed report, please don't hesitate to contact Ms. Laura Q. Gonzales at (858) 455-2758 or laura.gonzales@gat.com, or me at (858) 455-2823 or keith.asmussen@gat.com.

Very truly yours,

Keith E. Asmussen, Ph.D., Director
Licensing, Safety and Nuclear Compliance

Enclosure: GA report titled "Final Radiological Survey Report for Section C of the Building 2 (Science Laboratories Building) Service Corridor," dated March 2007.

- Appendix B: Building 2 Service Corridor, Section C, Confirmatory Survey.

Introduction

General Atomics (GA) is continuing its efforts directed at decontaminating, as appropriate, and obtaining the release to unrestricted use of selected facilities and land areas at General Atomics.

GA has recently completed the Final Radiological Survey of Section C of the Service Corridor of GA's Building 2 (Science Laboratories Building) located on GA's Main Site.

GA's Building 2 is a semi-circular "C"-shaped building consisting of laboratories and offices with five breezeways. It is a three-level structure comprised of a lower-level, an upper-level and mezzanines. Building 2 was constructed in three phases with each being a partial arc of a semi-circular structure. These three portions of the building are referred to as Sections A, B and C. A service corridor runs through each of these sections and separates upper and lower levels in each section. (See Figure 2A).

The Service Corridor of Section C comprises ~ 1/3 of the total service corridor of Building 2 and is located between and inclusive of lower-level labs and offices 300-359 and upper-level labs and offices 401-445. The total floor space area to be released to unrestricted use is approximately 9,496 ft² (~877 m²), which includes all three (3) levels, side rooms, and ventilation rooms above breezeway C.

GA is requesting both the Nuclear Regulatory Commission (NRC) and the State DHS/RHB (State) release Section C of the Building 2 (Science Laboratories Building) Service Corridor to unrestricted use.

This report documents the results of GA's radiological measurements completed within Section C of the Building 2 Service Corridor. The results of these surveys demonstrate that the service corridor of Section C, herein referred to as "Section C", meets the NRC- and State- approved criteria for release to unrestricted use.

Site Description

Building 2, a.k.a. the Science Laboratories Building or "L" (for Laboratory) Building, is located on General Atomics' Main Site (see Figure 1). Building 2 contains approximately 142 laboratories, plus offices, hallways, and a service corridor which houses the utilities for the labs and offices (see Figure 2A). The laboratories were used during the past ~50 years primarily for research and development activities involving the use of radioactive material.

All 142 laboratories within Building 2 were released to unrestricted use by both the NRC and the State of California in various "groups" of labs. Subsequently, GA amended its State Radioactive Materials License to add 9 labs as authorized use locations. Of these, labs 517, 523, 530/532, 534, 560/562/564 were added to do work involving basic biological research carried out by GA's

biosciences group, i.e., Diazyme, and lab 407 was added for work involving tritium diffusion studies. None of these laboratories are authorized to use or store radioactive materials in the service corridor of Building 2. The roof of Building 2 has been released to unrestricted use by the NRC. GA is awaiting the release of the roof by the State DHS/RHB.

The service corridor is approximately eight (8) feet wide and occupies the entire span of the semi-circular shaped Building 2 (see Figure 2A). There are three levels within the Service Corridor: (1) The easily accessible ground floor or Lower Level, also called Level 1 or the 1st Level; having a concrete floor, (2) The accessible middle level, also called the Level 2 or 2nd Level, which has metal grating as the floor, and (3) The top level, also called the Overhead Crawl Space, which has periodic metal grate landings and is difficult to access. The majority of the overhead crawl space is occupied by piping, ventilation ducts, and electrical cables. These levels are shown in Figure 3.

The service corridor contains all of the utilities, heating, and air conditioning needed by the laboratories. In addition, sewer drain lines which collect waste water from the laboratories and rest rooms are located beneath the first floor of the service corridor.

In 2000, the center three (3) feet of the concrete floor was removed and the sewer drain lines excavated throughout the entire length of the service corridor. A final radiological survey of the trench was performed in 2001. In April 2001, the report summarizing the results of this final radiological survey was submitted to the NRC and State of California, along with a request to release this trench to unrestricted use. The NRC released the trench to unrestricted use per SNM-696 license amendment #72 and the State released the trench to unrestricted use per 0145-37 license amendment #158. New sewer drain lines were installed, the trench was backfilled and a new concrete floor was poured in the center ~three feet of the first (lower) floor of the entire service corridor.

Due to the large size and complexity of the service corridor, it was sectioned off into three (3) survey sections: (1) Section A, (2) Section B and (3) Section C. This report only addresses Section C, which is shown in greater detail in Figures 2B and 2C. Section C of the service corridor occupies ~ $\frac{1}{3}$ of the total service corridor and is located between lower-level labs and offices 300-359 and between upper-level labs and offices 401-445. The column numbers (sometimes called I-beam numbers) in relation to the laboratories in Section C are also shown in Figures 2B and 2C.

In addition, there are two "side" rooms, connected to and accessible from the service corridor. These "side" rooms are (1) an electrical room that contains electrical transformers and switch gear, and (2) an elevator machinery room. There is also a large ventilation room above Breezeway C.

Section C is approximately 375 feet long. The lower level is approximately 9'7" high, the second level is approximately 8'10" high, and the crawl space is approximately 7'10" high. The first (lower) level has a concrete floor (the center 3' of which is new concrete), the second level floor is mostly steel grating, and the crawl space has sporadic metal grating landings over ~ $\frac{1}{4}$ of the total floor surface area. The remaining area is filled with piping, ducts, and electrical conduit/wires. The

service corridor can be accessed through doorways in some of the laboratories, at the breezeways which separate groups of laboratories, and from both ends of the semi-circular Building 2.

The total floor space of Section C is approximately 9,496 ft² (~877 m²); which is comprised of the following areas/locations:

<u>Location/Area</u>	<u>Area (ft²)</u>
First Level (lower level) floor area	3,000
Second Level (upper level)	3,000
Crawl Space (grated floor area)	750
Electrical Room	750
Elevator Machinery Room	24
Ventilation room above Breezeway C	<u>1,972</u>
	9,496

History of Use

The Service Corridor is used to provide utilities and other services to the Building 2 laboratories. On occasion, contaminated equipment and 55 gallon drums containing low levels of liquid radioactive waste were temporarily stored in the service corridor. These activities resulted in low levels of radioactive contamination in certain localized areas.

Decontamination Efforts and Classification

In 1994, a few ventilation ducts in the service corridor were identified as being contaminated with trace levels of radioactivity. In February 1994, all of the contaminated ducts, fans and motors that were found to be contaminated were removed and disposed of as low level radioactive waste at an authorized low-level radioactive waste disposal site. In May 1994, a survey of all of the ventilation systems remaining was completed and all additional contaminated equipment found was either removed and disposed of as low-level radioactive waste or decontaminated. Additional surveying was performed during this Final Survey.

Characterization surveys of the entire Service Corridor (i.e., Sections A, B and C) began in 1998. Samples of concrete surfaces found to be contaminated were collected and analyzed by gamma spectroscopy. The following areas within Section C were identified as having elevated radioactivity.

- (1) The first (lower) level between column numbers C51-C60, C64-C69, and C74-C1 (excluding the center 3 feet of the floor because it is new), and
- (2) The second (upper) level between column C51-C53, C56-C58, C64-C68, and C73-C75 (Grating and Walls).

On the basis of gamma spectroscopy analyses of concrete samples, U-235, U-238 and Cs-137

Final Radiological Survey Report for Section C of the Building 2 (Science Laboratories Building) Service Corridor

contamination was identified. U-235/U-238 contamination was identified in all of the areas; the maximum concentration found was 4.17 pCi/g U-235 on the floor and wall near column (or I-beam) C51. Cs-137 was detected near columns C57 and C58 at concentrations as high as 430 pCi/g. The floor required decontamination as far as 6" in depth to remove the contamination. Most areas were decontaminated to levels near or close to normal background levels (circa 1998).

In 2001, all of the contaminated drain lines were excavated and disposed of as low level radioactive waste at an authorized low-level radioactive waste disposal site. GA submitted a Final Radiological Survey Report to the NRC and State DHS/RHB for the resultant trench in April 2001 summarizing radiation levels and the results of gamma scan analyses of soil samples taken in the trench. The NRC subsequently performed a confirmatory survey and released the trench to unrestricted use (license amendment #72 to GA's SNM-696 license). In July 2004, the State DHS/RHB also released the trench to unrestricted use (license amendment #158). The trench, in the middle of the service corridor, was subsequently filled in with clean soil and covered with new concrete.

The original concrete that was broken/cut during the excavation of the contaminated drain lines was surveyed and the results confirmed radiation levels were well below release criteria. This concrete was placed in the former Soil Staging Area (SSA Bin T-31), and subsequently surveyed and released to unrestricted use by the NRC.

In January 2002, a Final Survey Plan for the Service Corridor was issued. The Plan was revised and supplements to the plan were later issued in 2003 and 2004. The plan and supplements are provided in Appendix A. Section C was classified as a Non-Suspect Affected Area.

During the performance of the final radiological survey of Section C in 2004, elevated activity levels were detected on the exterior surfaces of the wall louvers at columns C56 to C58 and C60 to C61. This area was reclassified as a "**Suspect Affected Area**". The contaminated louvers were removed and disposed of low level radioactive waste. The supporting frames were decontaminated using hand tools and janitorial equipment and new louvers were installed.

The remaining portions of Section C of the Building 2 Service Corridor were classified as a "**Non-Suspect Affected Area**".

The "Side Rooms" (electrical room and elevator machinery room) and the large ventilation room above Breezeway C were classified as "**Unaffected Areas**".

Criteria for Release to Unrestricted Use

As Low As Reasonably Achievable (ALARA)

During its decommissioning efforts, GA always attempts to decontaminate to levels as close to natural background levels, and as far below the NRC- and State- approved release criteria, as is reasonably achievable.

Facilities and Equipment (and Asphalt or Concrete Surfaces)

The predominate contaminates, based on process knowledge and isotopic analyses of concrete samples, were identified as U-235 and Cs-137. The U.S. NRC's and the State DHS/RHB's criteria for release of facilities and equipment contaminated with these radionuclides are provided in Tables 1 and 2, respectively. The applicable guidelines for enriched uranium and beta/gamma emitters (including Cs-137) are summarized as follows:

- 5,000 dpm/100 cm², averaged over a 1 m² area
- 15,000 dpm/100 cm², maximum in a 100 cm² area if the average over 1 m² is met
- 1,000 dpm/100 cm², removable activity

Exposure Rate Guideline

Pursuant to the NRC and State of California approved release criteria, exposure rates measured at 1 m above the surface are not to exceed 10 µR/hr above natural background levels.

Instrumentation and Background Measurements

A list of instruments used during the radiological surveys is shown in Table 3. The table includes: (1) a description of the instrument, model number and its serial number, (2) a description of the detector (if applicable) and its serial number, (3) instrument ranges, (4) calibration due dates, (5) typical background readings and (6) calibration efficiencies (if applicable). All of the instruments used were calibrated semiannually and after repair, except for exposure rate meters which were calibrated quarterly.

Background Measurements for Instruments/Detectors

Building 13 on GA's main site was used for conducting background measurements with instruments used for the final survey because: (1) There is no history involving the use or storage of radioactive materials in Building 13, and (2) The various surfaces and construction materials found inside the Building 2 service corridor could also be found within and outside of Building 13. Background information, where appropriate, is included in Table 3.

Minimum Detectable Activity (MDA)

Minimum detectable activities (MDA's) for instruments used for fixed measurements, for each type of surface (see Table 3), were calculated using equation (5-2) from the NUREG/CR-5849 as shown below:

Equation (5-2)

$$MDA = \frac{2.71 + 4.65\sqrt{B_R \times t}}{t \times E \times \frac{A}{100}} \text{ (dpm/100cm}^2\text{)}$$

Where:

- B_R = background rate (cpm)
- t = count time (min)
- E = efficiency (counts/disintegration)
- A = area of the detector (cm^2)

The MDA for scans using the 434 cm^2 gas flow proportional detector (floor monitor) was calculated using equation 5-3 from the draft NUREG/CR-5849 (modified in accordance with the discussion on page 5.8 of the draft NUREG/CR-5849), as follows:

Equation (5-3):

$$MDA = \frac{X \times B_R}{E \times \frac{A}{100}} \text{ (dpm/100cm}^2\text{)}$$

Where:

- X = the multiple/portion of the background rate that can be discernable as an increase in instrument response by the surveyor (dependent on the type of instrument used).
- B_R = background rate in (cpm)
- E = efficiency (counts/disintegration)
- A = area of the detector (cm^2)

Exposure Rate Background

The typical exposure rate background for GA's site using a Ludlum Model 19 micro R meter is 12-18 $\mu R/hr$ measured at 1 m from the surface of soil. This range of exposure rates can be measured south of Building 15 (an office building on the eastern portion of the GA site). Furthermore, measurements taken offsite in ten (10) different locations (nine (9) offsite and one (1) onsite at a non-impacted area near Building 15) over a period of 15 months also averaged $\sim 15 \mu R/hr$ (measured at 1 m from the surface). The range of 12-18 $\mu R/hr$ is typical at the GA site for the external dose rates measured at 1 meter from the surface. Background exposure rates in non-impacted areas, measured with the specific instruments used for this final survey, are identified in Table 3.

Final Surveys Performed

Objectives and Responsibilities

The objectives of the final survey plans were: (1) To demonstrate that the average surface residual contamination levels for each survey unit were below the approved release criteria, (2) To show that the maximum residual activity did not exceed three times the approved release criteria for average surface contamination value in an area up to 100 cm^2 , and, (3) That the exposure rate measurements taken in these areas, measured at 1 meter above the surface, were $<10 \mu R/hr$ above background.

GENERAL ATOMICS Final Radiological Survey Report for Section C of the Building 2 (Science Laboratories Building) Service Corridor

Survey Plans

A Final Survey Plan was developed based on the previous history of use, results of periodic surveys performed in the Building 2 Service Corridor, the radionuclides of concern, the potential for contamination, the various types of surfaces encountered and the classification of the various areas.

Additional supplements to this plan were issued to perform additional isotopic analysis on concrete samples, to perform surveys of the "side" rooms and crawl space and following the re-classification of an area. (Note: Some of the plans refer to other sections of the service corridor other than Section C). The survey plan and it's supplements are provided in Appendix A.

The final surveys were conducted in accordance with approved survey plans by qualified Health Physics Technicians having a minimum of three years health physics experience. Each survey taken was documented on a daily basis to a worksheet/drawing showing the approximate locations surveyed/sampled. Documentation includes the results of the measurements (including units), technician's signature, date, instrument(s) used (including model and serial number of both ratemeter and detector), calibration due date, % efficiency, and background readings (if applicable) and other pertinent information.

Survey Summary

Comparisons of the Site Decommissioning Plan requirements with the actual Final Surveys performed in relation to the percentage of surface area scanned, number of measurements (i.e., number of fixed radiation measurements), and exposure rate measurements ($\mu\text{R/hr}$) are provided below:

Comparisons of Site Decommissioning Plan Requirements with Final Surveys Performed in Section C of the Building 2 Service Corridor					
Survey Area ⁽¹⁾	Gridding Required ?	# of Direct Measurements Fixed α , β , or Wipes	Surface Scans α , β ,	# of Exposure Rate Fixed Measurements ($\mu\text{R/hr}$)	Exposure Rate Scan Measurements ($\mu\text{R/hr}$)
D-Plan ⁽²⁾ Unaffected Area (required) →	Not Required	Minimum of 5 (Based on 255 m ²) 1 per 50 m ² or 1 every ~7 m.	10% accessible floors & walls below 2m	Minimum of 26 (Based on 255 m ²) 1 per 10 m ² or 1 every ~3 m.	10% accessible floors and walls below 2m
Final Surveys Unaffected Area (performed) →	No	Total = 291 98 α , 97 β , & 96 wipes; plus large area wipes taken in crawl space.	10% floors 10% walls below 2m, except elevator mechanical room.	94 measurements	10% of floors and walls below 2m, 100% of Vent Louver external surfaces.

Comparisons of Site Decommissioning Plan Requirements with Final Surveys Performed in Section C of the Building 2 Service Corridor					
Survey Area ⁽¹⁾	Gridding Required ?	# of Direct Measurements Fixed α , β , or Wipes	Surface Scans α , β .	# of Exposure Rate Fixed Measurements (μ R/hr)	Exposure Rate Scan Measurements (μ R/hr)
D-Plan ⁽²⁾ Non-Suspect Affected Area (required) →	Not Required	Minimum of 69 (Based on ~1,385 m ²) 1 per 20 m ² or 1 every 4.5 m.	10% accessible floors & walls below 2m.	Minimum of 18 1 per 10 m ² or 1 every ~3 m	10% accessible floors and walls below 2m.
Final Surveys Non-Suspect Affected Area (performed) →	No	Total = 328 76 fixed α , 173 fixed β , & 79 wipes	100% floor & walls < 2m; 10% of walls above 2m (except new 3' of floor)	35 measurements 1 m from surface	1 st level - 100% of accessible floor & walls < 2m & 10% of walls > 2m; (except new middle 3' of floor); 100% of the grating on the 2 nd level
D-Plan ⁽²⁾ Suspect Affected Area (required) →	Yes, if feasible	Minimum of 379 (Based on 1,518 m ²) 1 per 4 m ² or 1 every 2m.	100% accessible floors & walls below 2m	Minimum of 47 1 per 4 m ² or 1 every 2m.	100% accessible floors and walls below 2m.
Final Surveys Suspect Affected Area (performed) →	Yes, Where possible	Total = 463 150 α , 166 β , & 147 wipes	100% of accessible floor & walls < 2m; 10% of walls > 2m (except new 3' of floor)	390 measurements	100% of accessible floor & walls < 2m; 10% of walls > 2m (except new 3' of floor)

- ⁽¹⁾ The total surface (Survey Required) area to be released:
 Unaffected Area= approximately 2,746 ft² (~ 255 m²), Floor Space Only.
 Non-Suspect Affected Area= approximately 14,896 ft² (~ 1,385 m²), Old Floor Space and walls up to 2m.
 Suspect Affected Area= approximately 16,325 ft² (~ 1,518 m²), Old Floor Space and walls up to 2m.
- ⁽²⁾ D-Plan = GA's NRC- and State- Approved Site Decommissioning Plan.

Results of the Final Surveys

The final radiological survey results for Section C, are provided in figures and tables as noted below:

Non-Impacted Areas

Electrical Room

See Figures 4, 5, and 6 for measurements locations and results, and, Table 5 for wipe analysis results. A summary of the survey results is as follows:

Alpha Fixed Activity: Four (4) measurements taken, all results were not distinguishable from normal background levels.

Beta Fixed Activity: Four (4) measurements taken, the highest result was 994 cp2m, which is equivalent to 276 dpm/100 cm²; far less than the NRC- and State- approved limits for release to unrestricted use.

Alpha Scans: 10% of floor surfaces and walls below 2m were scanned with a 434 cm² gas flow proportional detector. The results ranged from 10 to 50 cpm; not distinguishable from normal background levels.

Beta Scans: 10% of floor surfaces and walls below 2m were scanned with a 434 cm² gas flow proportional detector. The results ranged from 1,400 to 1,800 cpm, which are not distinguishable from normal background levels.

Loose Surface Activity: Four (4) wipe samples were taken and analyzed for α and β activity. All results are not discernible from natural background activity levels.

Exposure Rate Measurements: Four (4) exposure rate measurements were taken at 1 meter from the floor surfaces. The highest measurement was 17 μ R/hr, which is less than the approved release criteria of 10 μ R/hr above background (14 to 22 μ R/hr).

Exposure Rate Surface Scans: 10% of floor surfaces and walls below 2m were scanned with a 2" x 2" NaI (TI) detector held within 1" of the surface. The range was 15 to 22 μ R/hr, which is also below the approved release criteria.

Elevator Machinery Room at Breezeway C

See Figure 7 for measurement locations and results and, Table 5 for wipe analysis results. A summary of the survey results is as follows:

Alpha Fixed Activity: One measurement was taken, the result was not distinguishable from normal background levels.

Beta Fixed Activity: One measurement taken, the highest result was 970 cp2m, which is equivalent to 237 dpm/100 cm²; far less than the NRC- and State- approved release criteria.

Alpha Scans: 10% of floor surfaces and walls below 2m were scanned with a 434 cm² gas flow proportional detector. The results ranged from 0 to 30 cpm, which is at natural background levels.

Beta Scans: 10% of floor surfaces and walls below 2m were scanned with a 434 cm² gas flow proportional detector. The results ranged from 1,400 to 1,500 cpm, which is at natural background levels.

Loose Surface Activity: One wipe samples were taken and analyzed for α and β activity. The results were not distinguishable from normal background levels.

Fixed Exposure Rate Measurements: One exposure rate measurements were taken at 1 meter from the floor surfaces. The highest measurement was 14 $\mu\text{R/hr}$, which is at natural background levels.

Exposure Rate Surface Scans: 10% of floor surfaces and walls below 2m were scanned with a 2" x 2" NaI(Tl) detector held within 1" of the surface. The range was 14 to 17 $\mu\text{R/hr}$, which is at natural background levels.

Ventilation Room above Breezeway "C"

See Figures 8, 9, and 10 for measurement locations and results, and, Table 5 for wipe analysis results. A summary of the survey results is as follows:

Alpha Fixed Activity: Five (5) measurements taken, all results were not distinguishable from normal background levels.

Beta Fixed Activity: Five (5) measurements taken, the highest result was 860 cp2m, which is equivalent to 61 dpm/100 cm^2 ; less than the minimum detectable activity (MDA) level for the instrument used.

Alpha Scans: 10% of floor surfaces and walls below 2m were scanned with a 434 cm^2 gas flow proportional detector. The results ranged from 0 to 60 cpm, which are not distinguishable from normal background levels.

Beta Scans: 10% of floor surfaces and walls below 2m were scanned with a 434 cm^2 gas flow proportional detector. The results ranged from 700 to 1,400 cpm, which are not distinguishable from normal background levels.

Loose Surface Activity: Five (5) wipe samples were taken and analyzed for α and β activity. All results were not discernible from natural background activity levels.

Exposure Rate Measurements: Six (6) exposure rate measurements were taken at 1 meter from the floor surfaces. The highest measurement was 10 $\mu\text{R/hr}$, which is less at natural background levels.

Exposure Rate Surface Scans: 10% of floor surfaces and walls below 2m were scanned with a 2" x 2" NaI (Tl) detector held within 1" of the surface. The range was 6 to 12 $\mu\text{R/hr}$.

Service Corridor Overhead Crawl Space

See Figures 11, 12, 13, and 14 for measurement locations and results. A summary of the survey results is as follows:

Loose Surface Activity: Sixty-three (63) large area wipes were taken and analyzed in the field for α and β activity, all results were at natural background levels.

Exposure Rate Measurements: Eighty-four (84) exposure rate measurement were taken at 1 meter from the floor surfaces. The highest measurement was 12 $\mu\text{R/hr}$, which is at natural background levels.

Exposure Rate Surface Scans: 10% of all accessible surfaces were scanned with a 2" x 2" NaI (TI) detector held within 1" of the surface. The range was 5 to 13 $\mu\text{R/hr}$, which is at natural background levels.

Service Corridor Overhead Crawl Space Vent Louvers External Surfaces

See Figures 15, 16, 17, and 18 for measurement locations and result, and, Table 5 for wipe analysis results. A summary of the survey results is as follows:

Alpha fixed activity: Eighty-eight (88) fixed Alpha measurements were taken, all results were not distinguishable from normal background levels.

Beta Fixed Activity: Eighty-seven (87) measurements taken; results were not distinguishable from normal background levels.

Loose Surface Activity: Eighty-six (86) wipe samples were taken and analyzed for α and β activity. All results were not discernible from natural background activity levels. In addition, twenty-six (26) Large Area Wipe samples were taken and analyzed in the field with hand held instruments for alpha and beta activity. All wipe results which are not distinguishable from normal background levels.

Exposure Rate Surface Scans: 100% of all accessible surfaces were scanned with a 2" x 2" NaI (TI) detector held within 1" of the surface. The range was 5 to 12 $\mu\text{R/hr}$, which is at natural background levels.

Note: The louvers at column C60 to C61 and C55 to C58 were re-classified as a Suspect Affected Area. See the results for the surveys taken between these columns in the Suspect Affected Area section below.

Non-Suspect Affected Area

Fixed Alpha Measurements:

A total of seventy-six (76) α measurements were taken with the detector probe held within 1/2" for 30 seconds to 1 minute. All measurements were at the natural background level for the surfaces measured (0-20 cpm). See Figures 19, 20, 21, and 22 for the 1st (lowest) level survey locations and results, and, Figures 23, 24, 25, 26 and 27 for the 2nd level survey locations and results.

Fixed Beta Measurements:

A total of 173 β measurements were taken with the detector probe held within $\frac{1}{2}$ " for 2 minutes. The highest measurement was 263 dpm/100 cm² on the Floor at column C63 to C64 and C73 to C74 on the 1st level (see figures 20 and 22). This result is far less than the NRC- and State- approved release criteria. See Figures 19, 20, 21, and 22 for the 1st (lowest) level survey locations and results, and, Figures 23, 24, 25, 26 and 27 for the 2nd level survey locations and results.

Removable Contamination (Wipe) Surveys:

A total of 115 wipe samples were taken and analyzed for α and β activity. All results were not discernible from natural background activity levels. See Figures 19, 20, 21, and 22 for the 1st (lowest) level survey locations and results, and, Figures 23, 24, 25, 26 and 27 for the 2nd level survey locations, and, Table 4 for results.

Alpha Scans:

100% of the accessible floor and wall surfaces below 2m, with the exception of the middle three (3) feet of new floor material, and, 10% of the accessible walls above 2m, was scanned for α activity. All results were not distinguishable from normal background levels. See Figures 28, 29, 30, and 31 for the 1st level survey locations and results, and, Figures 32, 33, 34, 35, and 36 for the 2nd level survey locations and results.

Beta Scans:

100% of the accessible floor and wall surfaces below 2m, with the exception of the middle three (3) feet of new floor material, and, 10% of the accessible walls above 2m, was scanned for β activity. The highest activity level found was 2,800 cpm on the 2nd level between columns C71 and C74 (see Figure 31). This activity level is equivalent to 615 dpm/100 cm², which is far below the NRC- and State- approved release criteria identified in the GA Site Decommissioning Plan. See Figures 28, 29, 30, and 31 for the 1st level survey locations and results, and, Figures 32, 33, 34, 35, and 36 for the 2nd level survey locations and results.

Fixed Exposure Rate Measurements:

Thirty-five (35) exposure Rate measurements were taken in the center of the service corridor, on the 1st and 2nd level, at 1 m from the floor surface and approximately 1 m from both the inside and outside walls (simultaneously). All results were not discernible from natural background levels. See Figures 37, 38, 39, 53, and 40 for the 1st level survey locations and results, and, Figures 41, 42, 43, 44, and 45 for the 2nd level survey locations and results.

Exposure Rate Scans:

100% of the accessible floor and wall surfaces below 2m, with the exception of the middle three (3) feet of new floor material, and, 10% of the accessible walls above 2m on the first level was scanned with a 2" x 2" NaI (TI) detector held within 1" of the surface. On the second level, 100% of the grated floor was scanned. All results were not discernible from natural background activity levels. See Figures 37, 38, 39, 53, and 40 for the 1st level survey locations and results, and, Figures 41, 42, 43, 44, and 45 for the 2nd level survey locations and results.

Suspect Affected Area

Ventilation Louver Exterior Surfaces:

The following survey results were obtained from the surveys performed on the re-classified exterior surfaces of the ventilation louvers located on the outside walls of the Crawl Space, after D&D operations. See figures 15, 16, 17, and 18 for details.

Fixed Alpha Measurements:

A total of seventeen (17) α measurements were taken with the detector probe held within $\frac{1}{2}$ " for 30 seconds to 1 minute. All measurements were at the natural background level for the surfaces measured (20-40 cpm). See Figure 15 for survey locations and results.

Fixed Beta Measurements:

A total of sixteen (16) β measurements were taken with the detector probe held within $\frac{1}{2}$ " for 2 minutes. All measurements were at natural background levels. See Figure 16 for survey locations and results.

Removable Contamination (Wipe) Surveys:

A total of sixteen (16), 100 cm² wipe samples were taken and analyzed for α and β activity. All results were not discernible from natural background activity levels. See figure 18 for locations and Table 5 for results.

Alpha Scans:

100% of the surface was scanned with the detector held within $\frac{1}{2}$ " of the surface. All results were at natural background levels. See figure 15 for locations and results.

Beta Scans:

100% of the surfaces were scanned for β activity. The results were at natural background levels. See figure 16 for locations and results.

Exposure Rate Scans:

100% of the surfaces were scanned with a 2" x 2" NaI (Tl) held within 1" of the surface. All results were not discernible from natural background activity levels. See Figure 17 for survey locations and results.

Service Corridor:

Following D&D operations in the corridor areas re-classified as Suspect Affected Areas, a final survey was taken. A summary of the surveys taken, and their results, are as follows:

Fixed Alpha Measurements:

A total of 133 α measurements were taken with the detector probe held within $\frac{1}{2}$ " for 30 seconds to 1 minute. The highest measurement was 80 cpm, which is equivalent to 533 dpm/100cm², on the outside wall, middle (2nd) level, between columns C74 and C75 (See Figure 78 for location). This

activity level is far below the NRC- and State- approved release criteria. See Figures 48, 78, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, and 133 for all survey locations and results.

Fixed Beta Measurements:

A total of 150 β measurements were taken with the detector probe held within $\frac{1}{2}$ " for 2 minutes. The highest measurement was 2221 cp2m, which corresponds to 1852 dpm/100 cm², on the first level floor between columns C64 and C67 (see Figure 110). This result is far less than the NRC- and State- approved release criteria. See Figures 88, 91, 92, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, and 133 for all survey locations and results.

Removable Contamination (Wipe) Surveys:

A total of 131 wipe samples were taken and analyzed for α and β activity. All results were not discernible from natural background activity levels. See Figures 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, and 133 for survey locations, and, Table 4 for results.

Alpha Scans:

100% of the accessible floor and wall surfaces below 2m, with the exception of the middle three (3) feet of new floor material, and, 10% of the accessible walls above 2m, was scanned for α activity. The highest activity level discovered was 160 cpm, which is equivalent to 130 dpm/100 cm², located on a flight of stairs between columns C51 and C52 (see figure 48 for details). This activity level is far below the NRC- and State- approved release criteria identified in the GA Site Decommissioning Plan. See Figures 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, and 78 for all survey locations and results.

Beta Scans:

100% of the accessible floor and wall surfaces below 2m, with the exception of the middle three (3) feet of new floor material, and, 10% of the accessible walls above 2m, was scanned for β activity. The highest activity level found was 2,800 cpm, which is equivalent to 607 dpm/100 cm² (see Figure 55), which is far below the NRC- and State- approved release criteria identified in the GA Site Decommissioning Plan. See Figures 46, 49, 52, 55, 58, 61, 64, 67, 70, 73, 76, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, and 100 for all survey locations and results.

Fixed Exposure Rate Measurements:

390 fixed exposure Rate measurements were taken with a 2" x 2" NaI (TI) detector held at 1 m from the surface. All results were not discernible from natural background levels. See Figures 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, and 163 for survey locations and results.

Exposure Rate Scans:

100% of the accessible floor and wall surfaces below 2m, with the exception of the middle three (3)

feet of new floor material, and, 10% of the accessible walls above 2m on the first level was scanned with a 2" x 2" NaI (Tl) detector held within 1" of the surface. On the second level, 100% of the grated floor was scanned. All results were not discernible from natural background activity levels. See Figures 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, and 163 for survey locations and results.

Confirmatory Survey

A Confirmatory Survey was performed by GA Health Physics technicians who were not routinely assigned to the performance of the Final Survey. This survey was conducted during October and November, 2004 in accordance with a survey plan. The results of this survey supports the results of the Final survey; all residual activity is far below the NRC- and State approved release criteria as defined in the GA Site Decommissioning Plan. See Appendix B for the confirmatory survey plan, a survey summary, and the survey maps showing the locations and results of all surveys performed.

Conclusion

Final residual contamination and radiation surveys, as documented in this report, demonstrate that Section C of GA's Building 2 Service Corridor, meets the NRC- and State- approved criteria for release to unrestricted use.

Table 1: USNRC'S ACCEPTABLE SURFACE CONTAMINATION LEVELS ¹

Nuclides	Average ^{b,c,f} (dpm/100cm ²)	Maximum ^{b,d,f} (dpm/100 cm ²)	Removable ^{b,e,f} (dpm/100cm ²)
U-nat, ²³⁵ U, ²³⁸ U, & associated decay products	5,000 α	15,000 α	1,000 α
Transuranics, ²²⁶ Ra, ²²⁸ Ra, ²³⁰ Th, ²²⁸ Th, ²³¹ Pa, ²²⁷ Ac, ¹²⁵ I, ¹²⁹ I	100	300	20
Th-nat, ²³² Th, ⁹⁰ Sr, ²²³ Ra, ²²⁴ Ra, ²³² U, ¹²⁶ I, ¹³³ I, ¹³¹ I	1,000	3,000	200
Beta/gamma emitters (nuclides with decay modes other than alpha emission or spontaneous fission) except ⁹⁰ Sr and other noted above.	5,000	15,000	1,000

- a Where surface contamination by both alpha- and beta/gamma-emitting nuclides exists, the limits established for alpha- and beta/gamma-emitting nuclides should apply independently.
- b As used in this table dpm (disintegrations per minute) means the rate of emission by radioactive material as determined by correcting the counts per minute observed by an appropriate detector for background, efficiency, an geometric factors associated with the instrumentation.
- c Measurements of average contaminant should not be averaged over more than 1 square meter. For objects of less surface area, the average should be derived for each such object.
- d The maximum contamination level applies to an area of not more than 100 cm².
- e The amount of removable radioactive material per 100 cm² of surface area should be determined by wiping that area with dry filter or soft absorbent paper, applying moderate pressure, and assessing the amount of radioactive material on the wipe with an appropriate instrument of known efficiency. When removable contamination on objects of less surface area is determined, then pertinent levels should be reduced proportionally and the entire surface should be wiped.
- f The average and maximum radiation levels associated with surface contamination resulting from beta-gamma emitters should not exceed 0.2 mRad/hr at 1 cm² and 1.0 mRad/hr at 1 cm², respectively, measured through not more than 7 milligrams per square centimeter of total absorber.

Figure 77: Building 2 Service Corridor Section C Second (Middle) Level Inner Wall Column C 73 to C 75
Alpha Scan Measurement Locations and Results

Notes:

1. 100% of accessible area, 2 meters and below, 10% above 2 meters was scanned for alpha.
2. $\leftarrow \#\#\rightarrow$ Denotes alpha scan range in cpm as measured with the 434 cm² probe.
3. Areas not accessible with 434 cm² probe were scanned with the 50 cm² probe.
All readings <20 cpm.

**Final Radiological Survey Report for the Building 2
Service Corridor Section "C"**

Appendix A

**Final Survey Plans for the Building 2
Service Corridor Section "C"**

January 17, 2002

Prepared by: Laura Gonzales

Laura Gonzales 1/18/02

Final Survey Plan for the Building 2 Service Core

Background

Previous History and Use

The Service Core is used to provide utilities and other services to the Building 2 laboratories. Occasionally, contaminated equipment was stored in the service core. Additionally, 55 gallon drums were located in the service core which were used to store low levels or radioactively contaminated liquid waste. Previous surveys of the service corridor identified areas of contamination which have since been cleaned.

Exhaust Ducts, Motors and Fans

Ventilation ducting in the service core were identified in 1994 as being radioactively contaminated (some of these ducts were labeled with "Caution, Radioactive Materials" labels). In February 1994, removal of all radioactively contaminated ducts began and continued until they were all removed. In addition, a plan to inspect all lab exhausts and vents was formulated and surveys began. By May 1994, the surveys were completed. All contaminated ducts and/or exhausters were removed. As a result, no known contamination exists in the ventilation ducts.

Concrete Floor Surveys

The concrete was removed (after surveys showed it met the release criteria) and placed in GA's Main Site Soil Staging Area (SSA) Bin T-31. The survey results were documented in Figures A-1 through A-10, Figures B-1 through B-10 and Figures C-1 through C-10 of the SSA Bin T-31 release request package. The concrete was removed in order to remove the sewer drain lines.

Sewer Drain Lines

The sewer drain lines within the service corridor were removed and disposed of as radioactive waste. In addition, the sewer drain "lead outs" to 3 concrete storage vaults were also removed and disposed of as radioactive waste. The concrete storage vaults were decontaminated, as needed, and then released to unrestricted use. A Final Radiological Survey Report was submitted to the NRC and the State of CA in April 2001 summarizing the data collected in the resulting trench along with a request to release the trench to unrestricted use as follows: [Keith Asmussen Letter dated April 4, 2001 to Ms. Mary Adams and Dr. Ronald Rogus (696/CAL-3353) "Request to Release a Certain Portion of General Atomics' Site to Unrestricted Use and Delete it From License: Namely, Building 2 Service Corridor Drain Line Trench"]. The NRC had the lead NRC inspection report dated 10/16/01 was received by GA (70-734/01-03) as well as NRC released per NRC SNM-696 license amendment #72 releasing the trench to unrestricted use. A copy of the inspection report and license amendment was sent to the State on November 28, 2001 as follows: [Keith Asmussen Letter dated November 28, 2001 to Ms. Sudana Kwok (CAL-3422) "Transmittal of Copy of NRC SNM-696 License Amendment No. 72 Which Releases the Following to Unrestricted Use: (1) Building 2

Service Corridor Drain Line Trench and (2) LINAC North Land Area; with a copy of NRC Inspection Report 70-734/01-03"].

After NRC release of the trench to unrestricted use, GA obtained NRC and State of CA approval to backfill the trench with clean soil and to pour new concrete on the surface. This was done in December 2001. *Therefore, the majority of the concrete floor (on the lower level laboratories) is new and does not need to be surveyed (only the edges, ~18" from the each wall).*

Prior Decontamination

In addition to the removal of contaminated ventilation ducts and exhausters in 1994, several attempts to survey and decontaminate, as needed, have been made since then.

During implementation of a detailed Survey Plan dated December 8, 1997, approximately 42 contaminated areas were located. Each area was characterized and decontaminated, as needed. Decontamination was accomplished by using a wire brush, needle gun, jack-hammer, or other similar aggressive decontamination methods (including cutting-out grating and disposing it as radioactive waste). Post-decontamination surveys verified that decontamination was successful.

Purpose of Survey

This purpose of this Final Plan is to conduct a detailed survey in the Building 2 service core to ensure that the service core now meets the criteria for unrestricted release.

Objectives and Responsibility

The purpose of performing a final survey is to demonstrate that the radiological conditions in the service core satisfy the NRC and State of CA guidelines for release to unrestricted use. The objectives include (1) to show that the average surface contamination levels for each survey unit are within the authorized value, (2) to show that the maximum residual activity ("hot spot" area) do not exceed three times the average value in an area up to 100 cm² and (3) that a reasonable effort has been made to clean removable contamination and fixed contamination and (4) that the exposure rates in occupiable locations are less than 10 μ R/hr above background measured at 1 meter above the surface. Samples will be counted in GA's Health Physics laboratory. Surveys will be taken only by qualified Health Physics Technicians having a minimum of 3 years Health Physics Technician experience following approved Health Physics procedures and this Plan. The survey and final report documenting the survey will be performed by GA's Health Physics group.

Classification

Based on the fact that decontamination was previously performed, no additional radioactive contamination is expected to be found. Therefore, the service corridor is now classified as a "**non-suspect affected**" area.

Release Criteria (per GA Site Decommissioning Plan)

Concrete Surface

The applicable guidelines for residual contamination on concrete surfaces is based on the contaminant. At the current time, there is no known radiologically contaminated area within the service corridor. If elevated levels are found above normal background levels, samples will be collected and analyzed in order to determine what the contaminant(s) are and limits applied accordingly as follows:

Uranium

5,000 dpm α /100 cm², averaged over a 1 m² area
15,000 dpm α /100 cm², total, maximum in a 100 cm² area
1,000 α dpm/100 cm², removable activity

Gamma Emitters

5,000 dpm/100 cm², averaged over a 1 m² area
15,000 dpm/100 cm², total, maximum in a 100 cm² area
1,000 dpm/100 cm², removable activity

Sr-90

1,000 dpm α /100 cm², averaged over a 1 m² area
3,000 dpm α /100 cm², total, maximum in a 100 cm² area
200 α dpm/100 cm², removable activity

Thorium

1000 dpm/100cm², averaged over a 1 m² area
3000 dpm/100cm², maximum in a 100 cm² area if the average over 1 m² is met
200 dpm/100cm², removable activity

As interpreted by the NRC, the average 1000 dpm/100cm² and the maximum 3000 dpm/100cm² should apply to both alpha and beta measurements, independently, for surface contamination involving natural thorium. ("Interpretation of Thorium Surface Decontamination Limits," U.S. Nuclear Regulatory Commission, February 9, 1992). Thorium emits alpha radiation and beta radiation in a 1:0.67 ratio; therefore, *if beta radiation measurements are used to demonstrate compliance with the release criteria*, the corresponding average and maximum beta activity guidelines are 670 dpm/100cm² and 2000 dpm/100cm², respectively.

Exposure Rate Measurements

The guideline value for exposure rates measured at 1 m above the surface, is 10 μ R/hr above background.

Final Survey Plan

1. **Grid** as needed to properly identify the area and location of measurements.
2. **Exposure Rate Scanning** - Using a microR meter, scan 100% of the *old* floor concrete & 100% of the lower walls. Also, on the second floor, scan 100% of the grating and 100% of the lower walls (if possible).
3. **Conduct a 100% beta survey on the *old* concrete floor and lower walls (below 2 m) using a 434 cm² detector (wherever possible).** Check elevated areas using a hand held frisker (15 cm² pancake detector) and use the frisker in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
4. **Conduct a 100% alpha survey on the *old* concrete floor using and lower walls (below 2 m) using a 434 cm² detector (wherever possible).** Check elevated areas using a hand held 50 cm² alpha probe and/or use hand held probe in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
5. **Conduct a 10% beta scan on all accessible walls above 2 m using a 434 cm² detector (where ever possible).** Check elevated areas using a hand held frisker (15 cm² pancake detector) and use the frisker in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
6. **Conduct a 10% alpha scan on all accessible walls above 2 m using a 434 cm² detector (where ever possible).** Check elevated areas using a hand held 50 cm² alpha probe and/or use hand held probe in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
- 7.* **Conduct measurements on the floor & on the lower walls (at 1 m from the floor) – 1 every 4 m**
 - *For Measurements:
 - a. Alternate between an alpha fixed measurement, a beta fixed measurement and a smear.
 - b. Use a 50 cm² alpha probe for the alpha fixed measurements (~6 sec each).
 - c. Use the 100 cm² beta gas flow proportional counter - 2 min each measurement for beta.
 - d. For smears, take a 100 cm² wipe.
- 8.* **Conduct fixed measurement(s) using the 100 cm² beta detector on any location which appears to have been remediated or any similar suspect area (i.e., different color concrete or stained concrete).**
9. **Surveys of the Overhead Fixtures** - Do about a 10% survey.
 - ✓ Ventilation Ducts – Conduct scans, fixed beta and alpha measurements and smears
 - ✓ Lights - Conduct scans, fixed beta and alpha measurements and smears
 - ✓ Other Overhead Fixtures and Other Structures – Survey as needed and document.
10. **Exposure Rate Surveys at 1 m from the surface** - every 2 m. On lower and upper level.
11. **Floor Drains** - scan and smear all floor drains. Collect sample if possible.

12. **Grating on Second Floor**

- ✓ Conduct 100% gamma scan using microR meter,
- ✓ Conduct exposure rate measurements every 2 m at 1 m from the surface, and
- ✓ Conduct a measurement (alternate from alpha fixed, beta fixed and smear) 1 every 4 m.

13. **Lower Walls on Second Floor (unaffected)**

- ▶ Conduct 10% gamma scan using microR meter (if accessible)
- ▶ Conduct a measurement (alternate from alpha fixed, beta fixed and smear) 1 every 4 m.

Alert Levels

Alpha Alert Levels

If the following “alert levels” are exceeded, notify HP Management so an evaluation can be performed and to evaluate if decontamination is required.

- > 100 cpm alpha using the large area (434 cm²) probe (check area with a hand-held alpha meter).
- > 60 cpm using a 50 cm² hand-held alpha probe (~ 600 dpm/100 cm²)

Beta Monitoring

- >300 cpm above the appropriate background using the 434 cm² probe.
- >200 cpm above the appropriate background using the 100 cm² probe.
- >150 cpm above background using a portable GM detector.

Exposure Rate Measurements

- > 25 µR/hr at surface
- > 20 µR/hr at 1 m

Beta Alert Levels

If the following “alert levels” are exceeded, notify HP Management so an evaluation can be performed to determine if increased survey coverage is required or to evaluate if decontamination is required.

Documentation

Every survey conducted must be documented on a drawing showing the approximate locations surveyed. Include the results (include units), the technician’s signature, date, instrument(s) used (including model and serial number of both the rate meter and the detector), calibration due date, % efficiency, background readings (if applicable) and any other applicable information.

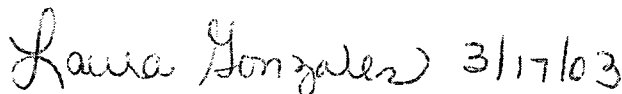

On a weekly basis (on Fridays), provide the surveys to Laura Gonzales for review.

Building 2 Service Corridor Final Survey Plan Supplement

The purpose of this Final Survey Plan Supplement is to provide survey requirements for the "side rooms" adjacent to the service corridor that were not surveyed during the Final Survey, and instructions for the taking of samples in Sections "A", "B", and "C" to determine the isotopic content of residual contamination.

Background

The Service Corridor is used to provide utilities and other services to the Building 2 laboratories. Occasionally, contaminated equipment was stored in the service corridor. Additionally, 55 gallon drums were located in the service corridor to store low levels of radioactive waste. A final survey for this service corridor was completed in accordance with a Survey Plan issued on January 17, 2002. This plan did not address the side rooms adjacent to the service corridor or the crawl space in the overhead. This supplement to the Final Survey Plan provides the minimum survey requirements for these areas and provides instruction for the sampling of sections "A", "B", and "C" to determine the isotopic content of the residual activity.

Classification

The service corridor is classified as a "**Non-Suspect Affected**" area. The "side rooms" and overhead have no history of radioactive material use or contamination, therefore, are classified as an "**Unaffected**" area.

Survey Objectives and Responsibility

The purpose of performing a final survey is to demonstrate that the radiological conditions within the Service Corridor satisfy the NRC and State of CA guidelines for release to unrestricted use. The objectives include (1) to show that the average surface contamination levels for each survey unit are within the authorized value, (2) to show that the maximum residual activity ("hot spot" area) do not exceed three times the average value in an area up to 100 cm² and (3) that a reasonable effort has been made to clean removable contamination and fixed contamination and (4) that the exposure rates in occupiable locations are less than 10 μ R/hr above background measured at 1 meter above the surface. Samples will be counted in the Health Physics laboratory (onsite). Surveys will be taken only by qualified Health Physics Technicians having a minimum of 3 years Health Physics Technician experience. The survey and final report documenting the survey will be performed by GA's Health Physics group.

Release Criteria (per GA Site Decommissioning Plan)

Concrete/Asphalt Surface Release Criteria

The NRC release criteria for Sr-90 and Thorium-232, which is conservatively selected for beta measurements, is:

1,000 dpm /100 cm², averaged over a 1 m² area
3,000 dpm /100 cm², total, maximum in a 100 cm² area
200 dpm/100 cm², removable activity

The NRC release criteria for most beta, gamma and Alpha activity (Sr-90 is not an alpha emitter) is:

5,000 dpm /100 cm², averaged over a 1 m² area
15,000 dpm /100 cm², total, maximum in a 100 cm² area
1,000 dpm/100 cm², removable activity

Exposure Rate Measurements

The guideline value for exposure rates measured at 1 m above the surface, is 10 µR/hr above background.

Alert Levels

Alpha Alert Values

If the following "alert levels" are exceeded, notify HP Management so an evaluation can be performed and to evaluate if decontamination is required.

- > 100 cpm alpha using the large area (434 cm²) probe (check area with a hand-held alpha meter).
- > 60 cpm using a 50 cm² hand-held alpha probe (~ 600 dpm/100 cm²)

Beta Monitoring

- >250 cpm above the appropriate background using the 434 cm² probe.
- >100 cpm above the appropriate background using the 100 cm² probe.
- >40 cpm above background using a portable GM detector. (**Note: this meter should ONLY be used in areas the 434cm² or 100 cm² probes will not fit).**)

Exposure Rate Measurements

- > 25 µR/hr at surface
- > 20 µR/hr at 1 m

Isotopic Determination Sampling

In each of the areas in section "A", "B", and "C" that were marked for additional surveying, remove the markings and enough additional material to fill ½ of a 100 ml container. Record the section and specific area (level and beam number) on the container and transport it to the HP Laboratory for gamma spectroscopy analysis.

Minimum Survey Requirements

Type of Survey/Activity	Non-Impacted Area
Crawl Space (Overhead)	
Gridding Required?	No
Minimum number of Measurements ⁽²⁾ ⁽³⁾	Perform a Large Area wipe of accessible surfaces every 4m. Analyze for α and β activity.
μ R/hr Readings (Scan Survey)	10% scan on all accessible surfaces with detector held ~1" from surface.
μ R/hr Readings (Fixed Measurements @ 1m from surface)	1 every 4m on accessible surfaces.
Side Rooms	
Gridding Required?	No
Concrete Surfaces ⁽¹⁾ (Scan w/ 434 cm ² alpha probe).	10 % on floor and up to 2m on walls.
Concrete Surfaces ⁽¹⁾ (Scan w/ 434 cm ² beta probe).	10 % on floor and up to 2m on walls.
Minimum number of Measurements ⁽²⁾ ⁽³⁾	1 measurement per 50 m ² , or, every 7m on floor and walls up to 2m. Alternate between (1) a wipe, (2) an alpha fixed measurement and (3) a beta fixed measurement on concrete surfaces .
μ R/hr Readings (Scan Survey)	10% scan on all surfaces below 2m with detector held ~1" from surface.
μ R/hr Readings (Fixed Measurements @ 1m from surface)	1 every 7m on floor and walls up to 2m.

Clean surfaces, debris or dirt removed.

For the fixed measurements:

- For α measurements; use either the hand held alpha counter (*minimum* of ~6 second count). Document all readings in cpm.
- For β measurements; take a 2 minute count using the 100 cm² gas flow proportional detector (beta) with the Model 2221 ratemeter. Document all readings and mark on a drawing the locations the readings were taken.
- For wipes, analyze each 100 cm² wipe for α and β activity.

A "measurement" is either (1) a "fixed" radiation measurement representing total activity or (2) a wipe (removable activity).

Building 2 Service Corridor Final Survey Plan Supplement-4

The purpose of this Final Survey Plan Supplement is to provide survey requirements for the locations in section C that had elevated activity requiring decontamination.

Background

The Service Corridor is used to provide utilities and other services to the Building 2 laboratories. Occasionally, contaminated equipment was stored in the service corridor. Additionally, 55 gallon drums were located in the service corridor to store low levels of radioactive waste. A final survey for this service corridor was completed in accordance with a Survey Plan issued on January 17, 2002. This plan did not address the side rooms adjacent to the service corridor or the crawl space in the overhead. A supplement to the Final Survey Plan, issued in March, 2003, provided the minimum survey requirements for these areas and provides instruction for the sampling of sections "A", "B", and "C" to determine the isotopic content of the residual activity.

During the performance of surveys in accordance with the original survey plan and its supplement, elevated activity levels were discovered in section C of the service corridor that required decontamination. In accordance with the GA Site Decommissioning Plan, if elevated activity is detected in a Non-Suspect Affected Area, the area must re-classified and surveyed accordingly.

Classification

Section C of the Building 2 Service Corridor is Re- classified as a "Suspect Affected" area in the following locations:

1. First (lowest) level between column numbers C-51 - C-60, C-64 - C-69, and C-74 - C-1 (floor and walls excluding the center 3 feet of the floor)
2. The second level between column C-51 - C-53, C-56 - C-58, C-64 - C-68, and C-73 - C-75. (grating and walls).

Survey Objectives and Responsibility

The purpose of performing a final survey is to demonstrate that the radiological conditions within the Service Corridor satisfy the NRC and State of CA guidelines for release to unrestricted use. The objectives include (1) to show that the average surface contamination levels for each survey unit are within the authorized value, (2) to show that the maximum residual activity ("hot spot" area) do not exceed three times the average value in an area up to 100 cm² and (3) that a reasonable effort has been made to clean removable contamination and fixed contamination and (4) that the exposure rates in occupiable locations are less than 10 µR/hr above background measured at 1 meter above the surface. Samples will be counted in the Health Physics laboratory (onsite). Surveys will be taken only by qualified Health Physics Technicians having a minimum of 3 years Health Physics Technician experience. The survey and final report documenting the survey will be performed by GA's Health Physics group.

Release Criteria (per GA Site Decommissioning Plan)

Concrete/Asphalt Surface Release Criteria

The NRC release criteria for Sr-90 and Thorium-232, which is conservatively selected for beta measurements, is:

1,000 dpm /100 cm², averaged over a 1 m² area
3,000 dpm /100 cm², total, maximum in a 100 cm² area
200 dpm/100 cm², removable activity

The NRC release criteria for most beta, gamma and Alpha activity (Sr-90 is not an alpha emitter) is:

5,000 dpm /100 cm², averaged over a 1 m² area
15,000 dpm /100 cm², total, maximum in a 100 cm² area
1,000 dpm/100 cm², removable activity

Exposure Rate Measurements

The guideline value for exposure rates measured at 1 m above the surface, is 10 µR/hr above background.

Alert Levels

Alpha Alert Values

If the following "alert levels" are exceeded, notify HP Management so an evaluation can be performed and to evaluate if decontamination is required.

- > 100 cpm alpha using the large area (434 cm²) probe (check area with a hand-held alpha meter).
- > 60 cpm using a 50 cm² hand-held alpha probe (~ 600 dpm/100 cm²)

Beta Monitoring

>250 cpm above the appropriate background using the 434 cm² probe.

>100 cpm above the appropriate background using the 100 cm² probe.

>40 cpm above background using a portable GM detector. (Note: this meter should ONLY be used in areas the 434cm² or 100 cm² probes will not fit).

Exposure Rate Measurements

> 25 μR/hr at surface

> 20 μR/hr at 1 m

Minimum Survey Requirements

Type of Survey/Activity	Suspect Affected Area
Gridding Required?	YES (When Possible)
Concrete Surfaces ⁽¹⁾ (Scan w/ 434 cm ² alpha probe).	100 % on accessible floor and walls up to 2m high. 10% above 2m. Note: The center 3 feet of the floor on the 1 st level is new, therefore it is not included in this classification and does not need to be surveyed.
Concrete Surfaces ⁽¹⁾ (Scan w/ 434 cm ² beta probe).	100 % on accessible floor and walls up to 2m high. 10% above 2m. Note: The center 3 feet of the floor on the 1 st level is new, therefore it is not included in this classification and does not need to be surveyed.
Minimum number of Measurements ⁽²⁾ ⁽³⁾	1 measurement per 4 m ² (1 every 2m). Alternate between (1) a wipe, (2) an alpha fixed measurement and (3) a beta fixed measurement on concrete surfaces. Analyze wipes for α and β activity. Note: The center 3 feet of the floor on the 1 st level is new, therefore it is not included in this classification and does not need to be surveyed.
μR/hr Readings (Scan Survey)	100% scan on all surfaces below 2m with detector held ~1" from surface, 10% above 2m. Note: The center 3 feet of the floor on the 1 st level is new, therefore it is not included in this classification and does not need to be surveyed.
μR/hr Readings (Fixed Measurements @ 1m from surface)	1 measurement per 4 m ² (1 every 2m). Note: The center 3 feet of the floor on the 1 st level is new, therefore it is not included in this classification and does not need to be surveyed.

(1) Clean surfaces, debris or dirt removed.

(2) For the fixed measurements:

- For α measurements; use either the hand held alpha counter (*minimum* of ~6 second count). Document all readings in cpm.
- For β measurements; take a 2 minute count using the 100 cm² gas flow proportional detector (beta) with the Model 2221 ratemeter. Document all readings and mark on a drawing the locations the readings were taken.
- For wipes, analyze each 100 cm² wipe for α and β activity.

(3) A "measurement" is either (1) a "fixed" radiation measurement representing total activity or (2) a wipe (removable activity).

Documentation

Every survey conducted must be documented **on a daily basis** on a drawing showing the approximate locations surveyed. Include the results (including units), the technicians signature, date, instrument(s) used (including model and serial number of both the ratemeter and the detector), calibration due date, % efficiency, background readings (if applicable) and any other applicable information.

Background Measurements

Background measurements must be made with each instrument used on each type of surface (i.e., concrete, metal, dry wall, etc.) prior to using the instrument.

Instrument Response Checks

Instrument response checks must be made on a daily basis for each instrument in use, prior to use, to assure the instrument is properly responding to the type of applicable radiation.

January 17, 2002

Revised February 12, 2002

Prepared by: Laura Gonzales

Final Survey Plan for the Building 2 Service Core

Background

Previous History and Use

The Service Core is used to provide utilities and other services to the Building 2 laboratories. Occasionally, contaminated equipment was stored in the service core. Additionally, 55 gallon drums were located in the service core which were used to store low levels or radioactively contaminated liquid waste. Previous surveys of the service corridor identified areas of contamination which have since been cleaned.

Exhaust Ducts, Motors and Fans

Ventilation ducting in the service core were identified in 1994 as being radioactively contaminated (some of these ducts were labeled with "Caution, Radioactive Materials" labels). In February 1994, removal of all radioactively contaminated ducts began and continued until they were all removed. In addition, a plan to inspect all lab exhausts and vents was formulated and surveys began. By May 1994, the surveys were completed. All contaminated ducts and/or exhausters were removed. As a result, no known contamination exists in the ventilation ducts.

Concrete Floor Surveys

The concrete was removed (after surveys showed it met the release criteria) and placed in GA's Main Site Soil Staging Area (SSA) Bin T-31. The survey results were documented in Figures A-1 through A-10, Figures B-1 through B-10 and Figures C-1 through C-10 of the SSA Bin T-31 release request package. The concrete was removed in order to remove the sewer drain lines.

Sewer Drain Lines

The sewer drain lines within the service corridor were removed and disposed of as radioactive waste. In addition, the sewer drain "lead outs" to 3 concrete storage vaults were also removed and disposed of as radioactive waste. The concrete storage vaults were decontaminated, as needed, and then released to unrestricted use. A Final Radiological Survey Report was submitted to the NRC and the State of CA in April 2001 summarizing the data collected in the resulting trench along with a request to release the trench to unrestricted use as follows: [Keith Asmussen Letter dated April 4, 2001 to Ms. Mary Adams and Dr. Ronald Rogus (696/CAL-3353) "Request to Release a Certain Portion of General Atomics' Site to Unrestricted Use and Delete it From License: Namely, Building 2 Service Corridor Drain Line Trench"]. The NRC had the lead NRC inspection report dated 10/16/01 was received by GA (70-734/01-03) as well as NRC released per NRC SNM-696 license amendment #72 releasing the trench to unrestricted use. A copy of the inspection report and license amendment was sent to the State on November 28, 2001 as follows: [Keith Asmussen Letter dated November 28, 2001 to Ms. Sudana Kwok (CAL-3422) "Transmittal of Copy of NRC SNM-696 License Amendment No. 72 Which Releases the Following to Unrestricted Use: (1) Building 2

Service Corridor Drain Line Trench and (2) LINAC North Land Area; with a copy of NRC Inspection Report 70-734/01-03"].

After NRC release of the trench to unrestricted use, GA obtained NRC and State of CA approval to backfill the trench with clean soil and to pour new concrete on the surface. This was done in December 2001. *Therefore, the majority of the concrete floor (on the lower level laboratories) is new and does not need to be surveyed (only the edges, ~18" from the each wall).*

Prior Decontamination

In addition to the removal of contaminated ventilation ducts and exhausters in 1994, several attempts to survey and decontaminate, as needed, have been made since then.

During implementation of a detailed Survey Plan dated December 8, 1997, approximately 42 contaminated areas were located. Each area was characterized and decontaminated, as needed. Decontamination was accomplished by using a wire brush, needle gun, jack-hammer, or other similar aggressive decontamination methods (including cutting-out grating and disposing it as radioactive waste). Post-decontamination surveys verified that decontamination was successful.

Purpose of Survey

This purpose of this Final Plan is to conduct a detailed survey in the Building 2 service core to ensure that the service core now meets the criteria for unrestricted release.

Objectives and Responsibility

The purpose of performing a final survey is to demonstrate that the radiological conditions in the service core satisfy the NRC and State of CA guidelines for release to unrestricted use. The objectives include (1) to show that the average surface contamination levels for each survey unit are within the authorized value, (2) to show that the maximum residual activity ("hot spot" area) do not exceed three times the average value in an area up to 100 cm² and (3) that a reasonable effort has been made to clean removable contamination and fixed contamination and (4) that the exposure rates in occupiable locations are less than 10 μ R/hr above background measured at 1 meter above the surface. Samples will be counted in GA's Health Physics laboratory. Surveys will be taken only by qualified Health Physics Technicians having a minimum of 3 years Health Physics Technician experience following approved Health Physics procedures and this Plan. The survey and final report documenting the survey will be performed by GA's Health Physics group.

Classification

Based on the fact that decontamination was previously performed, no additional radioactive contamination is expected to be found. Therefore, the service corridor is now classified as a "**non-suspect affected**" area (both the lower and the upper levels).

Release Criteria (per GA Site Decommissioning Plan)

Concrete Surface

The applicable guidelines for residual contamination on concrete surfaces is based on the contaminant. At the current time, there is no known radiologically contaminated area within the service corridor. If elevated levels are found above normal background levels, samples will be collected and analyzed in order to determine what the contaminant(s) are and limits applied accordingly as follows:

Uranium

5,000 dpm α /100 cm², averaged over a 1 m² area
15,000 dpm α /100 cm², total, maximum in a 100 cm² area
1,000 α dpm/100 cm², removable activity

Gamma Emitters

5,000 dpm/100 cm², averaged over a 1 m² area
15,000 dpm/100 cm², total, maximum in a 100 cm² area
1,000 dpm/100 cm², removable activity

Sr-90

1,000 dpm /100 cm², averaged over a 1 m² area
3,000 dpm /100 cm², total, maximum in a 100 cm² area
200 dpm/100 cm², removable activity

Thorium

1000 dpm/100cm², averaged over a 1 m² area
3000 dpm/100cm², maximum in a 100 cm² area if the average over 1 m² is met
200 dpm/100cm², removable activity

As interpreted by the NRC, the average 1000 dpm/100cm² and the maximum 3000 dpm/100cm² should apply to both alpha and beta measurements, independently, for surface contamination involving natural thorium. ("Interpretation of Thorium Surface Decontamination Limits," U.S. Nuclear Regulatory Commission, February 9, 1992). Thorium emits alpha radiation and beta radiation in a 1:0.67 ratio; therefore, *if beta radiation measurements are used to demonstrate compliance with the release criteria*, the corresponding average and maximum beta activity guidelines are 670 dpm/100cm² and 2000 dpm/100cm², respectively.

Exposure Rate Measurements

The guideline value for exposure rates measured at 1 m above the surface, is 10 μ R/hr above background.

Final Survey Plan

1. **Grid** as needed to properly identify the area and location of measurements.
2. **Exposure Rate Scanning** - Using a microR meter, scan 100% of the *old* floor concrete & 100% of the lower walls (lower level only).
3. **Conduct a 100% beta survey on the *old* concrete floor and lower walls (below 2 m) using a 434 cm² detector (wherever possible).** Check elevated areas using a hand held frisker (15 cm² pancake detector) and use the frisker in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
4. **Conduct a 100% alpha survey on the *old* concrete floor and lower walls (below 2 m) using a 434 cm² detector (wherever possible).** Check elevated areas using a hand held 50 cm² alpha probe and/or use hand held probe in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
5. **Conduct a 10% beta scan on all accessible walls above 2 m using a 434 cm² detector (where ever possible).** Check elevated areas using a hand held frisker (15 cm² pancake detector) and use the frisker in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
6. **Conduct a 10% alpha scan on all accessible walls above 2 m using a 434 cm² detector (where ever possible).** Check elevated areas using a hand held 50 cm² alpha probe and/or use hand held probe in areas where the 434 cm² probe cannot be used. Review past data to determine if contaminants have already been identified. If no data found, collect a sample and gamma scan.
- 7.* **Conduct measurements on the floor & on the lower walls (at 1 m from the floor) – 1 every 4 m**
***For Measurements:**
 - a. Alternate between an alpha fixed measurement, a beta fixed measurement and a smear.
 - b. Use a 50 cm² alpha probe for the alpha fixed measurements (~6 sec each).
 - c. Use the 100 cm² beta gas flow proportional counter - 2 min each measurement for beta.
 - d. For smears, take a 100 cm² wipe.
- 8.* **Conduct fixed measurement(s)** using the 100 cm² beta detector on any location which appears to have been remediated or any similar suspect area (i.e., different color concrete or stained concrete).

9. **Surveys of the Overhead Fixtures** - Do about a 10% survey.
 - ✓ Ventilation Ducts – Conduct scans, fixed beta and alpha measurements and smears
 - ✓ Lights - Conduct scans, fixed beta and alpha measurements and smears
 - ✓ Other Overhead Fixtures and Other Structures – Survey as needed and document.
10. **Exposure Rate Surveys at 1 m from the surface** - every 2 m. On lower and upper level.
11. **Floor Drains** - scan and smear all floor drains. Collect sample if possible.
12. **Grating on Second Floor**
 - ✓ Conduct 100% gamma scan using microR meter,
 - ✓ Conduct 100% beta scan with the 434 cm²
 - ✓ Conduct 100% alpha scan with the 434 cm²
 - ✓ Conduct a measurement 1 every 4 m (alternate from alpha fixed, beta fixed and smear), and
 - ✓ Conduct exposure rate measurements every 2 m at 1 m from the surface
13. **Lower Walls (< 2m) on Second Floor**
 1. Conduct 10% beta scan with the 434 cm² probe (or 100 cm² probe)
 2. Conduct 10% alpha scan with the 434 cm² probe
 - Note: Where contamination potential exists; e.g., decontaminated walls, discolored wall, conduct additional scans of the area.
 3. Conduct a measurement (alternate from alpha fixed, beta fixed and smear) 1 every 4 m.
14. **Upper Walls (> 2 m) on Second Floor**
 1. Conduct 10% beta scan with the 434 cm² probe (or 100 cm² probe)
 2. Conduct 10% alpha scan with the 434 cm² probe

Note: Check elevated areas using a hand held frisker (15 cm² pancake detector) and use the frisker in areas where the 434 cm² probe cannot be used.

Alert Levels

Alpha Alert Levels

If the following "alert levels" are exceeded, notify HP Management so an evaluation can be performed and to evaluate if decontamination is required.

- > 100 cpm alpha using the large area (434 cm²) probe (check area with a hand-held alpha meter).
- > 60 cpm using a 50 cm² hand-held alpha probe (~ 600 dpm/100 cm²)

Beta Monitoring

- >300 cpm above the appropriate background using the 434 cm² probe.
- >200 cpm above the appropriate background using the 100 cm² probe.
- >150 cpm above background using a portable GM detector.

Exposure Rate Measurements

> 25 μ R/hr at surface

> 20 μ R/hr at 1 m

Beta Alert Levels

If the following "alert levels" are exceeded, notify HP Management so an evaluation can be performed to determine if increased survey coverage is required or to evaluate if decontamination is required.

Documentation

Every survey conducted must be documented on a drawing showing the approximate locations surveyed. Include the results (include units), the technician's signature, date, instrument(s) used (including model and serial number of both the rate meter and the detector), calibration due date, % efficiency, background readings (if applicable) and any other applicable information.

On a weekly basis (on Fridays), provide the surveys to Laura Gonzales for review.

Confirmatory Survey Plan and Summary

CONFIRMATORY SURVEY PLAN

Prepared By: W. T. LaBonte

Approved By: Laura Q. Gonzales
L.Q. Gonzales

Building 2 Service Corridor Confirmatory Survey Plan

The purpose of this Confirmatory Survey Plan Supplement is to verify the radiological conditions identified during the performance of radiological surveys in accordance with the Final Survey Plan(s).

Background

The Service Corridor is used to provide utilities and other services to the Building 2 laboratories. Occasionally, contaminated equipment was stored in the service corridor. Additionally, 55 gallon drums were located in the service corridor to store low levels of radioactive waste. A final survey for this service corridor was completed in accordance with a Survey Plan issued on January 17, 2002. This plan did not address the side rooms adjacent to the service corridor or the crawl space in the overhead. A supplement to the Final Survey Plan, issued in March, 2003, provided the minimum survey requirements for these areas and provides instruction for the sampling of sections "A", "B", and "C" to determine the isotopic content of the residual activity. During the performance of surveys in accordance with the original survey plan and its supplement, elevated activity levels were discovered in section A of the service corridor that required decontamination. In accordance with the GA Site Decommissioning Plan, if elevated activity is detected in a Non-Suspect Affected Area, the area must re-classified and surveyed accordingly. Following decontamination of elevated activity areas, a fourth supplement to the Final Survey Plan was issued on January 29, 2004.

Classification

"Suspect Affected" areas) were identified as having elevated radiation levels in Section C.

1. First (lowest) level between column numbers C-51-60, C-64-69, and C-74-C-1 (excluding the center 3 feet of the floor because it is new)
2. The second level between column C-51-53, C-56-58, C-64-68, and C-73-75 (Grating and Walls).

The remaining portions of Section C of the Building 2 Service Corridor were classified as a "Non-Suspect Affected Area".

The "Side Rooms" (heating and air conditioning rooms, electrical shop, elevator shafts, etc.) were classified as "Unaffected Areas".

Survey Objectives and Responsibility

The purpose of performing this confirmatory survey is to demonstrate that the radiological conditions within the Service Corridor satisfy the NRC and State of CA guidelines for release to

unrestricted use. The objectives include (1) to show that the average surface contamination levels for each survey unit are within the authorized value, (2) to show that the maximum residual activity ("hot spot" area) do not exceed three times the average value in an area up to 100 cm² and (3) that a reasonable effort has been made to clean removable contamination and fixed contamination and (4) that the exposure rates in occupiable locations are less than 10 µR/hr above background measured at 1 meter above the surface. Samples will be counted in the Health Physics laboratory (onsite). Surveys will be taken only by qualified Health Physics Technicians having a minimum of 3 years Health Physics Technician experience.

Release Criteria (per GA Site Decommissioning Plan)

Concrete/Asphalt Surface Release Criteria

The NRC release criteria for Sr-90 and Thorium-232, which is conservatively selected for beta measurements, is:

1,000 dpm /100 cm², averaged over a 1 m² area
3,000 dpm /100 cm², total, maximum in a 100 cm² area
200 dpm/100 cm², removable activity

The NRC release criteria for most beta, gamma and Alpha activity (Sr-90 is not an alpha emitter) is:

5,000 dpm /100 cm², averaged over a 1 m² area
15,000 dpm /100 cm², total, maximum in a 100 cm² area
1,000 dpm/100 cm², removable activity

Exposure Rate Measurements

The guideline value for exposure rates measured at 1 m above the surface, is 10 µR/hr above background.

Alert Levels

Alpha Alert Values

If the following "alert levels" are exceeded, notify HP Management so an evaluation can be performed and to evaluate if decontamination is required.

- > 100 cpm alpha using the large area (434 cm²) probe (check area with a hand-held alpha meter).
- > 60 cpm using a 50 cm² hand-held alpha probe (~ 600 dpm/100 cm²)

Beta Monitoring

- >250 cpm above the appropriate background using the 434 cm² probe.
- >100 cpm above the appropriate background using the 100 cm² probe.
- >40 cpm above background using a portable GM detector.

Exposure Rate Measurements

- > 25 µR/hr at surface
- > 20 µR/hr at 1 m

Minimum Survey Requirements

Type of Survey/Activity	Non-Suspect Affected Area	Suspect Affected Area
Gridding Required?	Not Required	YES (as established during final survey)
Concrete Surfaces ⁽¹⁾ (Alpha Scan)	No Survey Required	On the Lower Level <u>ONLY</u> , 10 % on accessible floor (excluding the center of the floor which is new, only survey approximately 6" from each wall) and walls up to 2m high.
Concrete Surfaces ⁽¹⁾ (Beta Scan)	Perform a 10% scan of original flooring and 10% scan of walls.	On the Lower Level <u>ONLY</u> , 10 % on accessible floor (excluding the center of the floor which is new, only survey approximately 6" from each wall) and walls up to 2m high.
Minimum number of Measurements ⁽²⁾ ⁽³⁾	Spot check a minimum of 10 locations for fixed beta activity	Scan each of the remediated areas with a beta instrument. Taken at least one (1) fixed alpha, one (1) fixed beta in the area with the highest scan results in each remediated area. This applies to all three (3) levels.
μ R/hr Readings (Scan Survey)	No Survey Required	On the Lower Level <u>ONLY</u> , 10% scan on all surfaces below 2m (excluding the center of the floor which is new) with detector held ~1" from surface.
μ R/hr Readings (Fixed Measurements @ 1m from surface)	On the Lower Level <u>ONLY</u> , take 1 measurement every 10 m, in the center of the walkway, with the instrument held 1 m from the floor.	

(1) Clean surfaces, debris or dirt removed.

(2) For the fixed measurements:

- For α measurements; use either the hand held alpha counter (*minimum* of ~6 second count). Document all readings in cpm.
- For β measurements; take a 2 minute count using the 100 cm² gas flow proportional detector (beta) with the Model 2221 ratemeter. Document all readings and mark on a drawing the locations the readings were taken.
- For wipes, analyze each 100 cm² wipe for α and β activity.

(3) A "measurement" is either (1) a "fixed" radiation measurement representing total activity or (2) a wipe (removable activity).

CONFIRMATORY SURVEY SUMMARY

Appendix B

Building 2 Service Corridor "Section C" Confirmatory Survey Summary

Description

In October and November 2004, GA conducted an internal confirmatory survey of Section C of the Building 2 Service Corridor in accordance with a written plan (provided in this Appendix). The purpose of this survey was to determine if the final survey results effectively reflect the radiological conditions for this area. Following a review of the data collected, it was determined that the data, as documented by the surveyors, did not satisfy all of the survey requirements identified in the confirmatory survey plan. In March, 2006, portions of the confirmatory survey that appeared to be missing from the earlier effort, namely, Alpha and Beta scans with a 434 cm² proportional detector and fixed measurements in areas previously remediated, were performed.

The results of the confirmatory survey performed in October/November 2004 are as follows:

Exposure Rate Surface Scans and Results

100% of the "old" flooring and 10% of the walls on the lowest level (Level 1) were scanned with a 2" x 2" NaI (TI) detector held within 1" of the surface. The Results ranged from 18 to 27 μ R/hr on the "old" flooring. On the Second Level, 100% of the flooring and 10% of the walls were scanned with a 2"x 2" NaI (TI) detector held within 1" of the surface. The results were at natural background levels. In the Crawl Space (the 3rd level), 100% of the accessible walkways were scanned with a 2" x 2" NaI (TI) detector held within 1" of the surface. The results ranged from 6 to 12 μ R/hr. These results are not distinguishable from natural background measurements in enclosed concrete spaces similar to this corridor. See attached Figures 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 and 15 for locations and results.

Fixed Exposure Rate Measurements

Fixed exposure rate measurements were taken at 1 meter from the floor in decontaminated (scabbled) areas on the first level. The highest result was 25 μ R/hr at column C-66 to C-67. This result is natural background for a concrete enclosed area similar to this service corridor. See attached Figures 3, 4, and 5 for locations and results.

Alpha and Beta Scanning

10% of the "flooring and 10% of the accessible walls, and, all of the previously decontaminated (scabbled) areas, were scanned with 50 cm² gas flow proportional alpha and 15 cm² GM beta detectors held within 1" of the surface on the first and second levels. 10% of the "flooring" on the third level was scanned with 50 cm² gas flow proportional alpha and 15 cm² GM beta detectors held within 1" of the surface. The alpha results were all at natural background levels. The highest beta result was 100 cpm, which is less than the MDA for the detector used. See attached Figures 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 15 for locations and results.

Removable Contamination (wipe) Surveys

Eight (8) wipe samples were collect on the first level and analyzed for α and β activity. All results were at natural background levels. See attached Figures 1, 2, 3, 4, and 5 for locations and results.

The additional measurements taken in March 2006 are as follows:

Alpha and Beta Scanning

10% of the original concrete floor surfaces on the first (lowest) level and 10% of the floor gating surfaces on the second level were scanned with 434 cm² gas flow proportional detectors held within 1' of the surface. All Alpha measurement results were at natural background levels. The highest Beta measurement result was 2400 cpm, which equates to 569 dpm/100 cm². This is far less than the NRC- and State- approved release criteria. See Figures 1a, 2a, 3a, 4a, 5a, 6a, 7a, 8A, 9a, and 10a for locations and results.

Fixed Measurements

Twenty-four (24) Alpha and twenty-four (24) Beta fixed measurements were taken on the first (lowest) level in locations that had been remediated in the past. In addition, nine (9) Alpha and nine (9) Beta fixed measurements were taken in random locations on the second level. All Alpha measurement results, on both levels, were at natural background activity levels. The highest Beta measurement on the first level was 1404 cp2m, which is 550 dpm/100 cm². This is far below the NRC- and State- approved release criteria. See Figures 1a, 2a, 3a, 4a, 5a, 6a, 8a, 9a, and 10a for locations and results.

Removable Activity

An additional nineteen (19) wipe samples were collected in random locations on the second and third levels of Section C portion of the Building 2 service corridor. All samples collected were analyzed for Alpha and Beta activity in the Health Physics laboratory. All results were not discernible from natural background activity levels. See Figures 6a, 7a, 8a, 9a, 10a, 11, 12, 13, 14, and 15 for locations and results.

Conclusion

All of the Confirmatory Survey results indicated that the activity and radiation levels were all below approved release criteria for the Building 2 Service Corridor, "Section C" and were well in agreement with the results of the Final Survey performed on this site.
