Admin Task: Fire Doors Surveillance

Setting: Classroom
Type: RO
Task: CRO-P64-NORM-7
K&A: 2.1.20 (4.6/4.6) 2.2.12 (3.7/4.1)
Safety Function: NA
Time Required: 20 minutes
Time Critical: No
Faulted: No
Performance: Actual
Reference(s): 06-OP-SP64-M-0043, Fire Doors Alarm Check
Handout(s): 06-OP-SP64-M-0043, Fire Doors Alarm Check (Attachment 1 prepared)
Manipulations: NA
Critical Steps: 2
Group: NA

Simulator Setup/Required Plant Conditions:

- None

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The Plant is operating at rated power.
- 06-OP-SP64-M-0043 step 5.2.1 and 5.2.2 are performed as required by another operator.
- The CRS directs you to perform a partial 06-OP-SP64-M-0043, Fire Doors Alarm Check on the following doors: (1) Elect Pen Rm 1A221 door number 1A212, (2) Emerg S/D Rm OC208A door number OC208, and (3) Sec Ctmt Door 1A604.
- You note the following items during your inspection:
 - Elect Pen Rm 1A221 door 1A212:
 - Door does not latch after being fully opened and allowing the closure mechanism to pull the door shut; however, when you pull the door it latches.
 - Alarms after 1 second upon opening.
 - Emerg S/D Rm OC208A door OC208:
 - Has a deep gouge/dent 10” long on one side on the bottom right quadrant but does not penetrate the door skin.
 - Seam has separated next to the 10” gouge.
 - Alarms after 30 seconds upon opening.
 - Sec Ctmt Door 1A604:
 - Has a rust patch on the Aux Building Roof side that has left a 3 in² hole in the skin of the door (the inside door skin is not damaged).
 - Has not alarmed 4 minutes after opening.

Initiating Cue(s):

- Complete the attached 06-OP-SP64-M0043, Fire Doors Alarm Check surveillance, including all portions of Attachment 1 Cover Sheet sections 2.0 and 3.0. Only mark Tech Spec Acceptance Criteria as Acceptable if REQUIRED by 06-OP-SP64-M-0043 surveillance procedure.
- Note reasons for marking Tech Spec Acceptance Criteria or other steps/data in the test results section as “Acceptable” or “Unacceptable” on the back of the surveillance coversheet.
- All prerequisites are verified met.

Admin Task: Fire Doors Surveillance

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

- The operator will perform a Fire Door Alarm Check using the information provided in the initiating ques. The operator will discover tech spec door OC208 is INOP, tech spec door 1A212 is OPERABLE but requires a WR to fix the closing mechanism, and non-tech spec door 1A604 also requires a WR to fix the security alarm timing and a rust patch.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 06-OP-SP64-M-0043
<input type="checkbox"/> * <u><i>The operator evaluates the given conditions for each fire door given in the initiating cues and determines the following:</i></u> <ul style="list-style-type: none"> <input type="checkbox"/>* <u><i>Tech Spec Door 1A212 Tech Spec Acceptance Criteria is "Acceptable," but step 5.2.6 other steps/data is "Unacceptable" because the closing mechanism will not shut the door without assistance (see note for step 5.2.6).</i></u> <input type="checkbox"/>* <u><i>Tech Spec Door OC208 fails step 5.2.5c; however, the Tech Spec Acceptance Criteria for this surveillance is "Acceptable" (see note for step 5.2.5). The other steps/data is "Unacceptable".</i></u> <input type="checkbox"/> Tech Spec Door OC208 is INOP since it fails step 5.2.5c. <input type="checkbox"/>* <u><i>Door 1A604 is not a Tech Spec door; therefore, Tech Spec Acceptance Criteria is NA. Step 5.2.5a data is "Unacceptable" because the outside door skin is visibly damaged with a hole > 3/16".</i></u>
<p><u>Standard:</u> The deficiencies noted above are recorded on the surveillance cover sheet.</p>
<p><u>Cue:</u></p>
<p><u>Notes:</u> This meets the requirement for step 3.2 on the surveillance coversheet. Any words that demonstrate an equivalent understanding is acceptable.</p>

SAT / UNSAT

Step 2: 06-OP-SP64-M-0043

* Complete the surveillance coversheet section 3.1 by checking boxes for:
(1) Partial procedure complete,
(2)* Tech Spec Acceptance Criteria **Acceptable**, and
(3)* All other steps/data **Unacceptable**.

Standard: Checks appropriate boxes.

Cue:

Notes:

SAT / UNSAT

Step 3: 06-OP-SP64-M-0043

Complete the surveillance coversheet sections 2.1, 2.2 and 3.3

Standard: Circle for the plant being in Mode 1 and record themselves as performer with the date and time.

Cue:

Notes: JPM is completed when the operator completes the surveillance package coversheet.

SAT / UNSAT

Task Standard(s):

The operator determines that the Tech Spec Acceptance Criteria is “Acceptable” and that All other steps/data is “Unacceptable” per 06-OP-SP64-M-0043.

SAT / UNSAT

Admin Task: Fire Doors Surveillance

Follow-Up Questions & Answers:

Comments:

Give this page to the student

Initial Condition(s):

- The Plant is operating at rated power.
- 06-OP-SP64-M-0043 step 5.2.1 and 5.2.2 are performed as required by another operator.
- The CRS directs you to perform a partial 06-OP-SP64-M-0043, Fire Doors Alarm Check on the following doors: (1) Elect Pen Rm 1A221 door number 1A212, (2) Emerg S/D Rm OC208A door number OC208, and (3) Sec Ctmt Door 1A604.
- You note the following items during your inspection:
 - Elect Pen Rm 1A221 door 1A212:
 - Door does not latch after being fully opened and allowing the closure mechanism to pull the door shut; however, when you pull the door it latches.
 - Alarms after 1 second upon opening.
 - Emerg S/D Rm OC208A door OC208:
 - Has a deep gouge/dent 10” long on one side on the bottom right quadrant but does not penetrate the door skin.
 - Seam has separated next to the 10” gouge.
 - Alarms after 30 seconds upon opening.
 - Sec Ctmt Door 1A604:
 - Has a rust patch on the Aux Building Roof side that has left a 3 in² hole in the skin of the door (the inside door skin is not damaged).
 - Has not alarmed 4 minutes after opening.

Initiating Cue(s):

- Complete the attached 06-OP-SP64-M0043, Fire Doors Alarm Check surveillance, including all portions of Attachment 1 Cover Sheet sections 2.0 and 3.0. Only mark Tech Spec Acceptance Criteria as Acceptable if REQUIRED by 06-OP-SP64-M-0043 surveillance procedure.
- Note reasons for marking Tech Spec Acceptance Criteria or other steps/data in the test results section as “Acceptable” or “Unacceptable” on the back of the surveillance coversheet.
- All prerequisites are verified met.

Admin Task: Review Cooldown Record

Setting: Classroom
Type: RO
Task: CRO-ADMIN-07
K&A: 2.1.25 (3.9/4.2) 2.1.23 (4.3/4.4)
Safety Function: N/A
Time Required: 15 minutes
Time Critical: No
Faulted: No
Performance: Actual
Reference(s): 03-1-01-3, Plant Shutdown; TS 3.4.11
Handout(s): 03-1-01-3 Attachment 3 with data (Attached)
 Current TS Figure 3.4.11-1
Manipulations: N/A
Critical Steps: 2
Group: N/A

Simulator Setup/Required Plant Conditions:

- None

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The Plant is in Mode 3.
- Plant cooldown is in progress for a planned shutdown.
- A non-licensed operator has collected cooldown data using 03-1-01-3 Attachment 3, but no reviews have been performed.

Initiating Cue(s):

- The CRS directs you to review the cooldown data recorded by the non-licensed operator as the Reactor Operator in accordance with 03-1-01-3 to determine whether any limits have been exceeded.

Admin Task: Review Cooldown Record

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

- The operator will review cooldown data recorded on 03-1-01-3 Attachment 3 and identify the Tech Spec limit of 100F/hr has been exceeded.

Tasks : Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 03-1-01-3 Attachment 3	
<input type="checkbox"/> * <u>Review temperature data on 03-1-01-3 Attachment 3 and determine:</u> <input type="checkbox"/> * <u>The administrative limit of 90F was exceeded</u> <input type="checkbox"/> * <u>The Tech Spec limit of 100F was exceeded</u>	
<p><u>Standard:</u> The operator will calculate cooldown rates for reactor vessel temperatures and determine if any limits were exceeded. The operator will compare the pressures and temperatures recorded to curve B of TS Figure 3.4.11-1. The operator identifies the Administrative Limit of 90F/hr and the TS limit of 100F/hr was exceeded in the hour from 0300 to 0400 on Recirc Suction Temperatures A and B respectively.</p>	
<p><u>Cue:</u></p>	
<p><u>Notes:</u> R643 pt. 5 reads 311F at 0300 and 215F at 0400 for a 96F/hr cooldown rate during this period.</p> <p> R643 pt. 6 reads 311F at 0300 and 215F at 0400 for a 96F/hr cooldown rate during this period.</p>	
SAT / UNSAT	

Step 2: 03-1-01-3 Attachment 3

* Complete the review section of the cooldown data sheet of 03-1-01-3 Attachment 3 page 1 of 3.

* Check the Tech Spec Acceptance Criteria as "Unacceptable"

* Check the Admin Limit Criteria as "Unacceptable"

Initial as Verifier on right column of the Cooldown table

Sign the "Review performed by" line at the bottom of the page

Standard: Fills out the data sheet correctly

Cue:

Notes: See attached Key

SAT / UNSAT

Task Standard(s):

Review the cooldown record data sheet for plant shut down in accordance with 03-1-01-3 and Tech Spec 3.4.11 and identify the Tech Speck and Administrative cooldown rate limits have been exceeded.

Simulator Setup/Required Plant Conditions:

- None

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The Plant is operating at rated power.
- The Motor Driven Fire Pump C002-N Controller needs to be replaced.

Initiating Cue(s):

- The CRS directs you to prepare a Tagout Tags Sheet using EN-OP-102-01 Attachment 9.3 (Provided) to De-energize the Motor Driven Fire Pump C002-N for this maintenance.
- Restoration Configuration is not required.
- The next sequential tag serial number is "01."

Admin Task: Determine Tagging Requirements

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

- The operator will determine the proper isolations for the Motor Driven Fire Pump.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: EN-OP-102 5.3 [2] (e) / Att. 9.2
<input type="checkbox"/> * <u><i>The operator must determine minimum Tagout boundaries to include:</i></u> <input type="checkbox"/> * <u><i>52-11305 (MD Fire Pump Breaker)</i></u> <input type="checkbox"/> * <u><i>52-1P13229 (STRIP HEATER MOTOR DRIVEN FIRE PUMP)</i></u> <input type="checkbox"/> HS M602 (Control Room Manual Start Pushbutton)
<p><u>Standard:</u> Determines appropriate boundaries.</p>
<p><u>Cue:</u></p>
<p><u>Notes:</u> See the attached KEY for details.</p>
SAT / UNSAT

Step 2: EN-OP-102 5.3 [4]

* Complete the Tagout Tags Sheet of EN-OP-102-01 Attachment 9.3

See attached Tagout Tags Sheet KEY

Standard: Completes the Tagout Tags Sheet with required components from Step 1.

Cue:

Notes: EN-OP-102 Attachment 9.2 section 7.0 contains the Tagging Sequence guidance.

JPM complete when the operator completes the Tagout Tags Sheet.

SAT / UNSAT

Task Standard(s):

All required isolations are identified and correctly documented on the Tagout Tags Sheet in accordance with EN-OP-102.

SAT / UNSAT

Protective and Caution Tagging Forms & Checklist

Simulator Setup/Required Plant Conditions:

- None

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The Plant is operating at rated power.
- All fire detection devices are functioning properly.
- A partial 06-OP-SP64-M-0043, Fire Doors Alarm Check was just performed on the following doors: (1) Elect Pen Rm 1A221 door number 1A212, (2) Emerg S/D Rm OC208A door number OC208, and (3) Sec Ctmt Door 1A604.
- An operator reports the following after completing the 06-OP-SP64-M-0043:
 - Elect Pen Rm 1A221 door 1A212:
 - Door does not latch after being fully opened and allowing the closure mechanism to pull the door shut; however, when you pull the door it latches.
 - Alarms after 1 second upon opening.
 - Emerg S/D Rm OC208A door OC208:
 - Has a deep gouge/dent 10" long on one side on the bottom right quadrant but does not penetrate the door skin.
 - Seam has separated next to the 10" gouge.
 - Alarms after 30 seconds upon opening.
 - Sec Ctmt Door 1A604:
 - Has a rust patch on the Aux Building Roof side that has left a 3 in² hole in the skin of the door (the inside door skin is not damaged).
 - Has not alarmed 4 minutes after opening.

Initiating Cue(s):

- The Shift Manager asks you to determine the fire watch requirements associated with the indications given.
- Use the provided references.

Admin Task: Determine Fire Watch Requirements

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

- The operator will determine that tech spec fire door OC208 is INOP and set a fire watch in accordance with TR 6.2.8 for the Division 1 ESF Switchgear Room (Control Building Elevation 111’).

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 06-OP-SP64-M-0043
<p><input type="checkbox"/>* <u><i>The operator evaluates the given conditions for each fire door given in the initiating cues and determines the following:</i></u></p> <p style="margin-left: 20px;"><input type="checkbox"/> Tech Spec Door 1A212 is OPERABLE.</p> <p style="margin-left: 20px;"><input type="checkbox"/>* <u><i>Tech Spec Door OC208 is INOP because it fails step 5.2.5c.</i></u></p> <p style="margin-left: 20px;"><input type="checkbox"/> Door 1A604 is not a Tech Spec door; therefore, Tech Spec Acceptance Criteria is NA.</p>
<p><u>Standard:</u> Determine Door OC208 is INOP</p>
<p><u>Cue:</u></p>
<p><u>Notes:</u></p>
SAT / UNSAT

Step 2: TR 6.2.8

- * Per TR 6.2.8 Condition A and establish a continuous fire watch for action A.1 or hourly fire watch for action A.2.2 on at least one side of door OC208 (see notes below).

Standard: Establishes Fire Watch

Cue:

Notes: **Door OC208 is the door from the Division 1 ESF Switchgear Room to the Remote Shutdown Panels Room. The candidate may specifically identify a room number which requires a fire watch. In this case, either room number OC208A or OC202 is acceptable.**

JPM is complete when Fire Watch requirements are determined.

SAT / UNSAT

Task Standard(s):

The operator establishes a fire watch at least hourly for the Division 1 ESF Switchgear Room due to declaring tech spec door OC208 INOP in accordance with 06-OP-SP64-M-0043 and TR 6.2.8 Condition A.

SAT / UNSAT

Give this page to the student

Initial Condition(s):

- The Plant is operating at rated power.
- All fire detection devices are functioning properly.
- A partial 06-OP-SP64-M-0043, Fire Doors Alarm Check was just performed on the following doors: (1) Elect Pen Rm 1A221 door number 1A212, (2) Emerg S/D Rm OC208A door number OC208, and (3) Sec Ctmt Door 1A604.
- An operator reports the following after completing the 06-OP-SP64-M-0043:
 - Elect Pen Rm 1A221 door 1A212:
 - Door does not latch after being fully opened and allowing the closure mechanism to pull the door shut; however, when you pull the door it latches.
 - Alarms after 1 second upon opening.
 - Emerg S/D Rm OC208A door OC208:
 - Has a deep gouge/dent 10" long on one side on the bottom right quadrant but does not penetrate the door skin.

<u># Critical Steps:</u>	1
<u>Group:</u>	NA

Simulator Setup/Required Plant Conditions:

- None

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The plant is operating at 90% power with the following:
 - ❖ Division 1 Diesel Generator is out of service for repairs
 - ❖ 12 days ago a crane collided into the SSW 'A' pump house which breached the pump house outer wall (large through-wall crack).
 - ❖ SSW 'A' has been determined to be OPERABLE
- A severe thunder storm is over the site.
- The EOOS computer is not available.

Initiating Cue(s):

- The Shift Manager directs you to perform a risk assessment to determine the risk color for these current conditions.
- This is not a time critical task.

Admin Task: Manual Risk Assessment – Plant Safety Index

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

- This task is to use GGNS procedure 01-S-18-6 (Risk Assessment of Maintenance Activities) to perform a risk assessment and determine the associated risk color.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 01-S-18-6 step 6.5.2.a
<input type="checkbox"/> When the EOOS tool is not available for risk assessments, use Attachment IV (Level 1 out of service guidance table for use when EOOS is unavailable) for EOOS related risk and qualitative guidance in Attachment V.
<u>Standard:</u> Recognizes need to use both Attachment IV and Attachment V to perform this risk assessment.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 2: Attachment IV
<input type="checkbox"/> Review Attachment IV
<input type="checkbox"/> Determine that P75A, 'A' DIESEL GEN, out-of-service yields a risk color of GREEN.
<input type="checkbox"/> Determine that Weather/Grid, Severe Thunder Storm, yields a risk color of YELLOW.
<u>Standard:</u> Determines correct risk colors.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 3: Attachment V Table 1

* **Complete Attachment V, Table 1 Risk Assessment**

Check "Yes" Applicability for, "Exterior flood barrier or tornado missile barrier not available"

* Check "Yes" Applicability for, "Severe weather forecasted or imminent, with tornado missile barrier not available"

Standard: Checks both items "YES" and refers to Table 4. All other Applicability boxes are checked as "NO."

Cue: Examinee may ask Examiner if Engineering has determined that the degree to which the SSW 'A' pump house wall is damaged does in fact amount to an unavailable tornado missile barrier.

If asked, the answer is "Yes, that tornado missile barrier is considered to be unavailable."

Notes:

SAT / UNSAT

Step 4: Attachment V Table 4

* **Review Attachment V, Table 4 and determine proper risk color**

Determine that the breached SSW 'A' pump house wall (i.e., a "tornado missile barrier for a required Tech Spec system that is not available") for greater than 7 days but less than 30 days yields a risk color of YELLOW.

* *Determine that the breached SSW 'A' pump house wall (i.e., a "tornado missile barrier for a required Tech Spec system that is not available") combined with a severe thunder storm condition is equivalent to the first 'Plant Configuration' listed on Table 4. This Plant Configuration yields a risk color of ORANGE.*

Standard: Determines the correct risk colors.

Cue:

Notes: Task is complete when the Examinee reports to his Shift Manager that the risk color is ORANGE.

SAT / UNSAT

Task Standard(s):

Risk Assessment is performed per 01-S-18-6, applying at least Attachment IV and Attachment V Tables 1 and 4, to determine that a risk color of ORANGE exists for the current plant conditions.

SAT / UNSAT

Give this page to the student

Initial Condition(s):

- The plant is operating at 90% power with the following:
 - ❖ Division 1 Diesel Generator is out of service for repairs
 - ❖ 12 days ago a crane collided into the SSW 'A' pump house which breached the pump house outer wall (large through-wall crack).
 - ❖ SSW 'A' has been determined to be OPERABLE
- A severe thunder storm is over the site.
- The EOOS computer is not available.

Initiating Cue(s):

- The Shift Manager directs you to perform a risk assessment to determine the risk color for these current conditions.
- This is not a time critical task.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: EN-OP-102 5.3 [2] (e) / Att. 9.2	
<input type="checkbox"/> The operator must determine minimum Tagout boundaries to include: <ul style="list-style-type: none"> <input type="checkbox"/> NSP64-F160 (Mtr Driven Fw Pmp Casing Dr) <input type="checkbox"/> NSP64-F108 (Mtr Driven Fw Pmp Suct) <input type="checkbox"/> NSP64-F177 (Mtr Driven Fw Pmp Test Loop Isol) <input type="checkbox"/> NSP64-F016 (Mtr Driven Fw Pmp Disch) <input type="checkbox"/> 52-11305 (MD Fire Pump Breaker) <input type="checkbox"/> 52-1P13229 (STRIP HEATER MOTOR DRIVEN FIRE PUMP) <input type="checkbox"/> HS M602 (Control Room Manual Start Pushbutton) 	
<u>Standard:</u> Determines appropriate boundaries.	
<u>Cue:</u>	
<u>Notes:</u>	The valves listed are the minimum required valves required to perform work. Any combination of valves that adequately isolates the MDFP and provides a drain or vent path will meet the requirements of this step.
SAT / UNSAT	

Step 2:	
<input type="checkbox"/> * <i>The Operator documents the following:</i>	
<input type="checkbox"/> * <i>NSP64-F177 is required to isolate the test loop from the MDFP.</i>	
<input type="checkbox"/> * <i>52-1P13229 is required to isolate the strip heater power.</i>	
<input type="checkbox"/> HS-M602 is required by EN-OP-102 Att 9.2 section 1.1 (this tag is not required for safety of personnel).	
<input type="checkbox"/> HS-M002 is not necessary (or practical since it is a pushbutton).	
<u>Standard:</u>	Documents deficiencies.
<u>Cue:</u>	
<u>Notes:</u>	These requirements can be specifically found in EN-OP-102 Attachment 9.2 sections 1.1 and 2.1 and Attachment 9.3 sections 1.1 and 1.4. Any words that demonstrate an equivalent understanding is acceptable.
	The task is complete when the operator determines the adequacy for this Tagout.
	SAT / UNSAT

<u>Task Standard(s):</u>
The operator indentifies the tagout lacks the required isolations per EN-OP-102.
SAT / UNSAT

Give this page to the student

Initial Condition(s):

- The Plant is operating at rated power.
- The Motor Driven Fire Pump C002-N needs a new impeller.
- The pump motor will need to be removed for access.

Initiating Cue(s):

- As CRS you are tasked to verify the adequacy of the proposed tagout for work on the Motor Driven Fire Pump C002-N.
- Document errors or inadequate boundaries.

Critical Steps: 1
Group: NA

Simulator Setup/Required Plant Conditions:

- None

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The Plant is operating in Mode 3 with a plant shutdown in progress due to loss of DC bus 11DA.
- A bus fault occurred on ESF bus 16AB. Electrical estimates that the bus may be re-energized in approximately 45 minutes.
- An operator reported 20 minutes ago that 11DB bus voltage is 104 VDC and trending down.
- A fire that began 18 minutes ago continues to burn in the Division 3 battery room. Operators immediately de-energized the 11DC bus as soon as the fire started.

Initiating Cue(s):

- Classify the event.
- This is a time critical task.

Admin Task: DC Electrical Failures – EAL Determination

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

- Event classification JPM in accordance with Emergency Preparedness Plan.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 10-S-01-1
<input type="checkbox"/> * <i>Classify the event as a SITE AREA EMERGENCY</i>
<u>Standard:</u> EAL SS4, Site Area Emergency
<u>Cue:</u>
<u>Notes:</u> <p style="text-align: right;">SAT / UNSAT</p>
<p>Summary of Candidate’s thought process used to make this determination:</p> <ol style="list-style-type: none"> 1. Recognize that a fire has been burning for greater than 15 minutes inside the Protected Area (i.e., Div 3 battery room is in the Control Building, one of the VITAL AREAS listed on Table H3). This alone would be classified as an Unusual Event because of EAL HU4. 2. Recognize that all “Vital DC Power” has been lost (i.e., loss of Div 1 DC bus 11DA has precipitated the plant shutdown; the Div 2 DC bus 11DB has indicated less than 105 VDC for at least 20 minutes; the Div 3 DC bus 11DC was immediately lost when the Div 3 battery room fire started 18 minutes ago. 3. Recognize that the Loss of all Vital DC Power warrants a Site Area Emergency because of EAL SS4.

<p><u>Task Standard(s):</u></p> <p>Within 15 minutes, classify the event as a Site Area Emergency in accordance with EAL SS4.</p> <p style="text-align: right;">SAT / UNSAT</p>

Task: Shifting Reactor Recirc Pumps to Fast Speed

Setting: Simulator
Type: RO
Task: CRO-B33(1)-005
K&A: 202001: A4.01 (3.7/3.7)
Safety Function: Recirculation System
Time Required: 25 minutes
Time Critical: No
Alternate Path: Yes
Performance: Actual
Reference(s): 04-1-01-B33-1/4.2/6.2/6.3
Handout(s): None
Manipulations: 6
Critical Steps: 4
Group: 2

Simulator Setup/Required Plant Conditions:

1. In the Simulator Instructor Booth, ensure Director is running and reset the simulator to IC-43 (IC with plant ready to upshift Recirc Pumps)
2. Perform or verify the following:
 - Verify plant power between 30% and 32% power
 - Verify load line < 75%
 - Verify feedwater flow > 4.0 mlbm/hr.
 - Verify Recirc Pump “B” operating in SLOW speed with FCV 95% open
 - Verify Recirc Pump “A” operating in FAST speed with:
 - FCV at min position
 - Reset cavitation interlock
 - Depress the Recirc Pump “A” start PB
 - Verify FCTR in SETUP (remote function c51310)
 - Verify that all prerequisites contained in section 4.2.1 of 04-1-01-B33-1 are satisfied.
3. Insert Malfunction rr196b (Incomplete Sequence B)

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The plant is in power ascension, approximately 34% power.
- Recirc Pump A is in FAST speed
- APRM FCTR cards are in SETUP
- Breakers CB-3B and CB-4B are racked in and closed.
- Requirements for entry into Restricted Region have been met.

Initiating Cue(s):

- The Shift Manager has directed you to shift Reactor Recirc Pump B to FAST speed.
- All prerequisites are met.
- This task is not time critical.

Task: *Shifting Reactor Recirc Pumps to Fast Speed*

Notes: (Notes to Evaluator)

1. Several parameter verifications must be made prior to transferring a Recirc pump to fast speed. The standard for doing so offers only one source for this instrumentation. There may be more than one source, so the standard usually states "or equivalent" to let the evaluator know that there may another legitimate way to verify the parameter.
2. Unless otherwise indicated, all controls and indications for this task are on panel 1H13-P680-3A - 3C.
3. If asked about monitoring for THI, inform the trainee that another operator will monitor for THI.
4. This task begins at 04-1-01-B33-1/ Step 4.2.2

Task Overview: (Detailed description of task)

- This task shifts the second Reactor Recirculation Pump to fast speed in preparation for power ascension.
- The first recirc pump is already in fast speed.
- The fault in this task is that RRP fast speed breaker CB-5B fails to close, resulting in an Incomplete Start Sequence and a system shutdown.
- The operator will enter the Reduction in Recirc System Flow ONEP and close the discharge valve for the B Recirc Pump completing the JPM.
- The core must be closely monitored for Thermal Hydraulic Instability (THI). For this task, it will be assumed that another operator will monitor for THI.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-B33-1 step 4.2.2a(1)

- * **ADJUST** *Recirc Loop B FCV to MIN ED position as follows:*
 - * **USING** *Recirc Loop B FLO CONT on 1H13-P680, **THEN CLOSE** Recirc Loop B FCV until MIN ED ($\approx 20\%$) is just indicated on B33 Process Diagram **OR** Computer point B33N027B.*
 - ALLOW** computer point B33K658B.C88 at least 5 seconds for computer point updates.
 - IF** sufficient PDS computer points are **NOT** available, a FCV position of approximately $\approx 20\%$ **USING** FEEDS indication May be used to set FCV.

Standard: Adjust B flow control valve to 20% open (Min Ed).

Cue:

Notes:

SAT / UNSAT

Step 2: 04-1-01-B33-1 step 4.2.2a(2)

- CHECK** seal purge flow **AND** seal cavity pressure normal.
 - Seal purge flow 1.5 to 2.5 gpm. (Local C11-FI-R020B).
 - CHECK** #1 seal cavity pressure slightly higher than Reactor pressure.
 - CHECK** #2 seal cavity pressure indicates approximately half the value of #1 seal cavity pressure.

Standard: Check purge flow and cavity pressures are normal.

Cue: Report Seal Purge Flow as 2.0 gpm when asked as the local operator to check seal purge flow.

Notes:

SAT / UNSAT

Step 3: 04-1-01-B33-1 step 4.2.2a(3)	
<input type="checkbox"/>	CHECK pump AND motor temperature normal on Recirc Pump Recorder 1B33-TR-R601 on 1H13-P614.
<u>Standard:</u>	
Cue:	When the operator is on this step, inform the operator that all temperatures are normal.
Notes:	This recorder is broken in the simulator.
SAT / UNSAT	

Step 4: 04-1-01-B33-1 step 4.2.2a(4)	
<input type="checkbox"/>	OBSERVE annunciators associated with Loop B HPU, seal flow, AND pump temperatures extinguished on 1H13-P680-3A.
<u>Standard:</u>	Observes indications listed.
Cue:	
Notes:	
SAT / UNSAT	

Step 5: 04-1-01-B33-1 step 4.2.2a(5)	
<input type="checkbox"/>	* <i>DEPRESS RECIRC PMP B CAV INTLK RESET pushbutton on 1H13-P680 AND OBSERVE respective status light deenergizes.</i>
<u>Standard:</u>	Depress pushbutton.
Cue:	

Notes: If the status light is already deenergized (i.e. interlock already reset) then this step is NOT critical.

SAT / UNSAT

Step 6: 04-1-01-B33-1 step 4.2.2a(6)

DEPRESS RX WTR LVL LO INTLK B RESET pushbutton on 1H13-P680 **AND OBSERVE** respective status light deenergizes.

Standard: Depress pushbutton.

Cue:

Notes:

SAT / UNSAT

Step 7: 04-1-01-B33-1 step 4.2.2a(7)

* **RAISE** respective *BOP transformer tap setting to about 7.2 kV on Bus 11HD(12HE) for pump to be shifted.*

Standard: On panel P807, raise the tap setting on transformer 11B by turning the BOP XFMR 11B X-WDG TO BUS 12HE LTC clockwise to the "RAISE" position until approximately 7.2 KV is indicated on meter R22-R603.

Cue:

Notes:

SAT / UNSAT

Step 8: 04-1-01-B33-1 step 4.2.2a(8)

NOTIFY Chemistry **AND** Radiation Protection of the possibility of a crud burst as a result of the Recirculation pump speed transfer.

Standard: Notifies Chemistry and RP.

Cue: Chemistry and RP is notified.

Notes:

SAT / UNSAT

Step 9: 04-1-01-B33-1 step 4.2.2a(9)

- * DEPRESS START pushbutton on TRANS TO LFMG/START handswitch on 1H13-P680 for Recirc Pump B.
- CHECK** the following:
 - CB-2B LFMG B GEN BRKR FDR 252-1205A, OPENS.
 - CB-1B, LFMG B MTR FDR 152-1411 OPENS.
 - Recirc Pump B COASTS down to less than 360 rpm.

Standard: Depress pushbutton.

Cue:

Notes:

SAT / UNSAT

Step 10: 04-1-01-B33-1 step 4.2.2a(10)	
<input type="checkbox"/>	WHEN pump speed lowers below 360 rpm, CHECK that CB-5B, RECIRC PUMP B FDR, 252-1205) CLOSED.
<u>Standard:</u>	Observes that breaker CB-5B DOES NOT close and Annunciator "PMP B AUTO XFER INC" P680-3A-D9 actuates.
<u>Cue:</u>	When the operator reports that Recirc Pump B did not start, as the CRS direct the operator to enter the Reduction in Recirc System Flow ONEP (05-1-02-III-3) and implement the immediate and subsequent actions.
<u>Notes:</u>	This begins the alternate path for this JPM.
SAT / UNSAT	

Step 11: 05-1-02-III-3 step 3.1	
<input type="checkbox"/>	MONITOR APRMs, LPRMs, SRM period meters, and PBDS Computer Trends. <u>IF</u> operating in the Restricted or Monitored Region <u>and</u> thermal hydraulic instability is observed, <u>THEN IMMEDIATELY SCRAM</u> the Reactor.
<u>Standard:</u>	
<u>Cue:</u>	As the CRS inform the operator that another operator will have the responsibilities as THI watch and to continue with the ONEP subsequent actions.
<u>Notes:</u>	No conditions meet the requirements of step 2.1 Immediate Operator Actions.

SAT / UNSAT

Step 12: 05-1-02-III-3 step 3.2
<input type="checkbox"/> * <i>IF one Recirc pump has stopped, THEN CLOSE RECIRC PMP B DISCH VLV B33-F067B.</i>
<u>Standard:</u> Closes B33-F067B
<u>Cue:</u> This completes the JPM.
<u>Notes:</u>
SAT / UNSAT

<u>Task Standard(s):</u>
The B Recirc Pump is tripped with the B33-F067B closed per 04-1-01-B33-1 SOI.
SAT / UNSAT

Give this page to the student

Initial Condition(s):

- The plant is in power ascension, approximately 32% power.
- Recirc Pump A is in FAST speed
- APRM FCTR cards are in SETUP
- Breakers CB-3B and CB-4B are racked in and closed.
- Requirements for entry into Restricted Region have been met.

Initiating Cue(s):

- The Shift Manager has directed you to shift Reactor Recirc Pump B to FAST speed.
- All prerequisites are met.
- This task is not time critical.

Task: RCIC Manual Startup

Setting: Simulator
Type: RO
Task: CRO-E51-003
K&A: 217000: A4.04 – 3.6/3.6
Safety Function: Reactor Core Isolation Cooling System (RCIC)
Time Required: 15 minutes
Time Critical: No
Alternate Path: Yes
Performance: Actual
Reference(s): 04-1-01-E51-1 section 5.2.2
 ARI 1H13-P601-21A-G3
Handout(s): None
Manipulations: 12
Critical Steps: 8
Group: 1

Simulator Setup/Required Plant Conditions:

- IC-31 (or any full power IC).
- Start SSW A per the SOI.
- Ensure P11-F064 and P11-F065 auxiliary building isolation valves are open on P870.
- Insert Malf. **E51050** at severity **100** and delay **10** on trigger 1, "steam leak in RCIC room upstream of E51F045"
- From Director, open Event.exe
 - Double click event 1 and then click "Edit Event"
 - In event code type: zlo4(665) == 1
 - Click validate to confirm that it evaluates as "FALSE"
 - Click OK, then click OK on the edit event screen.
- Insert EP **Attachment 3** as **DONE**, "RCIC Div 1 and 2 Isolations bypassed".

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- SSW A is in service.
- Another operator is monitoring Suppression Pool temperature per 06-OP-1M24-V-0001.
- All prerequisites are met.

Initiating Cue(s):

- The CRS directs you to do a controlled manual startup of RCIC in the CST-to-CST mode, with the following parameters:
 - 800 gpm flow
 - 300 psig discharge pressure
- This task is not time critical.

Task: RCIC Manual Startup

Notes: (Notes to Evaluator)

1. Unless otherwise stated, all control manipulations will be at panel P601 in the Main Control Room.

Task Overview: (Detailed description of task)

- This task starts the RCIC system by manual operation of the system's individual components and controls.
 - The normal means of starting RCIC for Rx level control would be automatic as a function of Rx level or depressing the system's automatic initiation pushbutton.
- The critical skills examined here are the operator's ability to locate and operate RCIC system controls in a manner that would provide for safe, uninterrupted operation of the system without reliance on the logic that would automatically operate this system in the same manner. Also, diagnostics involved for recognition of a steam line break and failure of the automatic isolation to occur, along with effecting the required isolation will be examined.
- The fault in this task is a RCIC Steam Line break in the RCIC room with failure of the automatic isolation.
 - Continued operation of RCIC in this condition without isolating the steam supply line would lead to damage of equipment in the RCIC room and restricted personnel habitability, possibly spreading to other areas within the auxiliary building.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 02-S-01-27 Ops Philosophy 6.6.13
<input type="checkbox"/> Place the RCIC DIV 1 and 2 MOV TEST switches in TEST.
<u>Standard:</u> Place switches in TEST.
<u>Cue:</u>
<u>Notes:</u> Must be performed prior to RCIC valve operation for credit.
SAT / UNSAT

Step 2: 04-1-01-E51-1 step 5.2.2b
<input type="checkbox"/> START RCIC RM FAN COIL UNIT USING RCIC RM FAN COIL UNIT handswitch on 1H13-P870-1C.
<u>Standard:</u> Start fan, observing red light on and green light off.
<u>Cue:</u>
<u>Notes:</u> - If step 5.2.2a is performed, this will constitute a failure of this JPM. - Step 5.2.2c is NA since the initial conditions indicate this step is complete. The operator may verify the SSW lineup.
SAT / UNSAT

Step 3: 04-1-01-E51-1 step 5.2.2d
<input type="checkbox"/> IF desired to run RCIC in recirculation mode only, CLOSE F268, PRESS LOCK ISO FOR F013; to PREVENT flow to the reactor due to disc flexing of E51-F013. (Concurrent Verification Required)
<u>Standard:</u> Directs local operator to close E51-F268.
<u>Cue:</u> E51-F268 is closed.
<u>Notes:</u> step 5.2.2e is NA

SAT / UNSAT

Step 4: 04-1-01-E51-1 step 5.2.2f

* ***Shift RCIC FLO CONT to MANUAL.***

Standard: Place Controller E51-R600 in manual.

Cue:

Notes:

SAT / UNSAT

Step 5: 04-1-01-E51-1 step 5.2.2g

* ***Reduce RCIC FLO CONT output to minimum.***

Standard: Lower E51-R600 controller to 0%

Cue:

Notes:

SAT / UNSAT

Step 6: 04-1-01-E51-1 step 5.2.2h

* ***OPEN F046 USING RCIC WTR TO TURB LUBE OIL CLR handswitch.***

Standard: Opens E51-F046, observing red light on and green light off.

Cue:

Notes:

SAT / UNSAT

Step 7: 04-1-01-E51-1 step 5.2.2i

* **START Turbine Gland Seal compressor USING RCIC GL SEAL COMPR handswitch.**

Standard: Start compressor, observing red light on and green light off.

Cue:

Notes:

SAT / UNSAT

Step 8: 04-1-01-E51-1 step 5.2.2j

* **OPEN F095 USING RCIC STM SPLY BYP VLV handswitch.**

Standard: Open valve, observing red light on and green light off.

Cue:

Notes:

SAT / UNSAT

Step 9: 04-1-01-E51-1 step 5.2.2k

* **AFTER 6 seconds, OPEN F045 USING RCIC STM SPLY TO RCIC TURB handswitch.**

Standard: Opens E51-F045, observing red light on and green light off.

<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 10: 04-1-01-E51-1 step 5.2.2l
<input type="checkbox"/> RAISE turbine speed to develop greater than 2000 rpm USING RCIC FLO CONT in MANUAL.
<u>Standard:</u> Raises turbine speed >2000 rpm as indicated on E51-R605.
<u>Cue:</u>
<u>Notes:</u> An over-speed trip during this step will constitute a failure of the JPM.
SAT / UNSAT

Step 11: 04-1-01-E51-1 step 5.2.2m(1)

- * ***WHEN*** discharge pressure is above 125 psig, ***ESTABLISH*** RCIC discharge flow path.
- * ***OPEN*** F059 ***USING*** RCIC OTBD TEST RTN TO CST handswitch.
- * ***OPEN*** F022 ***USING*** RCIC INBD TEST RTN TO CST handswitch.
- THROTTLE OPEN** FV-F551 **USING** RCIC TEST RTN FCV TO CST handswitch.
- RAISE** turbine speed as desired to establish desired flow.

Standard: Open E51-F059 and E51-F022, observing red lights on and green lights off.

Cue: If asked for guidance, as the CRS direct the operator to ensure automatic actions occur.

Notes: Once E51-F022 is open, the steam leak will be triggered. The operator will have indications of a steam leak in the RCIC room as indicated by: (1) RCIC area temp high alarms (P601-21A-H2, H3, G3), (2) RCIC steam line high ΔP alarms (P601-21A-C1,D1), (3) PDS EP-4 Operator Guide, (4) E31N602B on 1H13P642.

SAT / UNSAT

Step 12: 02-S-01-27 Ops Philosophy 6.1.1b

- * Close E51-F063 or E51-F064, RCIC Steam Supply Isolation Valves to isolate the steam leak in the RCIC room.

Standard: Closes E51-F063 and E51-F064, observing red lights off and green lights on.

Cue:

Notes: This completes the JPM. Depressing RCIC MAN ISOL pushbutton will not isolate RCIC steam supply and is not functional unless RCIC has been manually or automatically initiated.

SAT / UNSAT

Task Standard(s):

RCIC was started IAW SOI 04-1-01-E51-1. RCIC steam supply line was isolated by closing E51F063 or E51F064 to isolate the steam leak in the RCIC room.

SAT / UNSAT

Task: RCIC Manual Startup

Follow-Up Questions & Answers:

Comments:

Give this page to the student

Initial Condition(s):

- SSW A is in service.
- Another operator is monitoring Suppression Pool temperature per 06-OP-1M24-V-0001.
- All prerequisites are met.

Initiating Cue(s):

- The CRS directs you to do a controlled manual startup of RCIC in the CST-to-CST mode, with the following parameters:
 - 800 gpm flow
 - 300 psig discharge pressure
- This task is not time critical.

Task: Rotate EHC Pumps – Pump A to Pump C

Setting: Simulator
Type: RO
Task: CRO-N32-006
K&A: 241000: A2.06 – 3.1/3.2 Generic 2.1.30: 4.4/4.0
Safety Function: 3 - Reactor Pressure Control
Time Required: 10 minutes
Time Critical: No
Alternate Path: **Yes**
Performance: Actual
Reference(s): 04-1-01-N32-1 section 5.1
Handout(s): None
Manipulations: 6
Critical Steps: 5
Group: 2

Simulator Setup/Required Plant Conditions:

- IC-31
 - Reduce power to 95% using FCV's (87.9 mlbm/hr)
 - Ensure the lead TCV is <65% open.
- Verify EHC pumps A and B are operating and EHC pump C is in standby.
- Open and play schedule file GJPM-OPS-2011CR3
- OR -
- On TRIGGER 10 insert the following instrument overrides:
 - ior ao_1n32r612 time delay 0, ramp 30 seconds, final value 410
 - ior ao_1n32r627 time delay 0, ramp 30 seconds, final value 150

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The plant is at rated power.
- EHC pumps A and B are in operation.

Initiating Cue(s):

- The CRS has directed you to rotate from EHC pump A to EHC pump C, such that EHC pumps B and C are left in operation, in accordance with 04-1-01-N32-1 section 5.1.
- An operator is at the EHC pumps standing by for instructions.

Task: Rotate EHC Pumps – Pump A to Pump C

Notes: (Notes to Evaluator)

1. All controls and indications for this task are on panel 1H13-P680.

Task Overview: (Detailed description of task)

- This task is to rotate from EHC pump A in operation to EHC pump C in operation, placing EHC pump A into standby.
- The fault in this task is the failure EHC pump C to maintain normal control fluid pressures.
- The operator will then be redirected return EHC pump A to operation and place EHC pump C into standby.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-N32-1 step 5.1.1 Prerequisites
<input type="checkbox"/> Verifies prerequisites for rotating EHC pumps are met. <ul style="list-style-type: none"> <input type="checkbox"/> EHC FLUID PUMP C handswitch is in AUTO on 1H13-P680-10C (white light lit). <input type="checkbox"/> Annunciator "CF PMP SWITCH TO AUTO", 1H13-P680-10A (C-5), is <u>not</u> in Alarm. <input type="checkbox"/> Lead turbine control valve N11-F026D to be <65% open.
<u>Standard:</u> Verifies prerequisites are met.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 2: 04-1-01-N32-1 step 5.1.2a
<input type="checkbox"/> * <i>PLACE STANDBY EHC Fluid pump into operation by first DEPRESSING CF PMP A/B/C START pushbutton,</i> (1) THEN DEPRESS respective Auto pushbutton.
<u>Standard:</u> Starts EHC pump C.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 3: 04-1-01-N32-1 step 5.1.2b
<input type="checkbox"/> OBSERVE that discharge pressure on EHC Fluid pump just started is approximately the same as the other running pumps by MONITORING applicable local pressure indicators: <ul style="list-style-type: none">• CF PMP A, 1N32-PI-R006A (low pressure) 1N32-PI-R018A (high pressure)• CF PMP B, 1N32-PI-R006B (low pressure) 1N32-PI-R018B (high pressure)• CF PMP C, 1N32-PI-R006C (low pressure) 1N32-PI-R018C (high pressure)
<u>Standard:</u> Directs the local operator to observe EHC pump discharge pressures.
<u>Cue:</u> As the local operator, report the low and high discharge pressures are normal for EHC pump C and are approximately the same as discharge pressures of EHC pumps A and B.
<u>Notes:</u>

SAT / UNSAT

Step 4: 04-1-01-N32-1 step 5.1.2c

- * ***SHUT DOWN*** one of the running EHC Fluid pumps by ***DEPRESSING CF PMP A/B/C STOP pushbutton on 1H13-P680-10C.***
- WAIT** approximately 30 seconds, **THEN DEPRESS** applicable CF PMP A/B/C AUTO pushbutton.
- * ***OBSERVE that CF PRESS HP SIDE AND CF PRESS LP SIDE remain at greater than 445 psig AND 175 psig respectively on 1H13-P680-10B.***
- Clear annunciator "CF PMP SWITCH TO AUTO," 1H13-P680-10A (C-5).

Standard: Stops EHC pump A.

Cue: **When the operator reports abnormal control fluid pressures as a result of the pump shift, direct the operator as the CRS to shift EHC pumps to EHC pumps A and B running with EHC pump C in standby.**

Notes: **A malfunction will be inserted when EHC Pump A is stopped. This will cause pump discharge pressure to drop to 410 psig and 150 psig.**

Simulator Operator Trigger **Event 10** when the operator stops EHC pump A.

SAT / UNSAT

Step 5: 04-1-01-N32-1 step 5.1.2a

* ***PLACE STANDBY EHC Fluid pump into operation by first **DEPRESSING CF PMP A/B/C START pushbutton,*****

(1) **THEN** DEPRESS respective Auto pushbutton.

Standard: Starts EHC pump A.

Cue:

Notes: **EHC pressures will return to normal.**

Simulator Operator Trigger **Event 11** when the operator starts EHC pump A.
- OR -
manually adjust AO_1N32R612 to 577 in 30 seconds
manually adjust AO_1N32R627 to 198 in 30 seconds

SAT / UNSAT

JOB PERFORMANCE
MEASURE

Step 6: 04-1-01-N32-1 step 5.1.2b

OBSERVE that discharge pressure on EHC Fluid pump just started is approximately the same as the other running pumps by **MONITORING** applicable local pressure indicators:

- CF PMP A, 1N32-PI-R006A (low pressure)
1N32-PI-R018A (high pressure)
- CF PMP B, 1N32-PI-R006B (low pressure)
1N32-PI-R018B (high pressure)
- CF PMP C, 1N32-PI-R006C (low pressure)
1N32-PI-R018C (high pressure)

Standard: Directs the local operator to observe EHC pump discharge pressures.

Cue: **As the local operator, report the low and high discharge pressures are normal for EHC pump A and are approximately the same as discharge pressures of EHC pumps A and C.**

Notes:

SAT / UNSAT

Step 7: 04-1-01-N32-1 step 5.1.2c

- * ***SHUT DOWN*** *one of the running EHC Fluid pumps by **DEPRESSING CF PMP A/B/C STOP** pushbutton on 1H13-P680-10C.*
- WAIT** approximately 30 seconds, **THEN DEPRESS** applicable CF PMP A/B/C AUTO pushbutton.
- OBSERVE** that CF PRESS HP SIDE **AND** CF PRESS LP SIDE remain at greater than 445 psig **AND** 175 psig respectively on 1H13-P680-10B.
- Clear annunciator "CF PMP SWITCH TO AUTO," 1H13-P680-10A (C-5).

Standard: Stops EHC pump C.

Cue: As the CRS, prompt the operator to secure EHC pump C.

Notes: This ends the JPM.

SAT / UNSAT

Task Standard(s):

EHC Pump A has been placed back into operation and EHC Pump C has been returned to standby in accordance with 04-1-01-N32-1 section 5.1 after it was determined EHC Pump C would not maintain normal control fluid pressures.

SAT / UNSAT

Entergy

Task: Rotate EHC Pumps – Pump A to Pump C

Follow-Up Questions & Answers:

Comments:

Give this page to the student

Initial Condition(s):

- The plant is at rated power.
- EHC pumps A and B are in operation.

Initiating Cue(s):

- The CRS has directed you to rotate from EHC pump A to EHC pump C, such that EHC pumps B and C are left in operation, in accordance with 04-1-01-N32-1 section 5.1.
- An operator is at the EHC pumps standing by for instructions.

Task: Startup Shutdown Cooling B

<u>Setting:</u>	Simulator
<u>Type:</u>	RO
<u>Task:</u>	CRO-E12-008
<u>K&A:</u>	205000 A4.01 – 3.7/3.7; A4.02 – 3.6/3.5; A4.03 – 3.6/3.5
<u>Safety Function:</u>	4
<u>Time Required:</u>	15 minutes
<u>Time Critical:</u>	No
<u>Faulted:</u>	No
<u>Performance:</u>	Actual
<u>Reference(s):</u>	04-1-01-E12-2 sect 4.2.2c
<u>Handout(s):</u>	None
<u># Manipulations:</u>	6
<u># Critical Steps:</u>	6
<u>Group:</u>	1

Simulator Setup/Required Plant Conditions:

- Initialize the simulator to IC 3 Reactor in Mode 4 < 200 degrees F
- Verify/start SSW B in operation to the RHR B heat exchangers.
- Secure the RHR Shutdown Cooling lineup.
 - Stop the B RHR pump.
 - Close/Verify Closed:
 - B21-F065A and F065B; E12- F004B; F008; F064B; F009; F053B and F006B
 - Shutdown the B RHR Jockey Pump.
- Verify/start RHR Room B Fan Coil Unit.
- Place the RHR B MOV TEST and NSSSS MOV TEST (2) switches in TEST.

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- RHR B was previously in service for Shutdown Cooling but was secured.
- Radiation Protection and Chemistry personnel have been notified of the startup of RHR 'B' Shutdown Cooling.
- RHR B has been flushed, warmed up and is ready to be placed in Shutdown Cooling.
- SSW B is in operation.
- ADHR is not in operation.
- RHR Room B Fan Coil Unit is running.
- The B RHR Jockey Pump has been secured.
- The RHR B MOV TEST switch in TEST.
- Both NSSSS MOV TEST switches are in TEST.

Initiating Cue(s):

- The CRS directs you to place RHR B in Shutdown Cooling through E12-F053B, starting at Step 4.2.2c(12) of SOI 04-1-01-E12-2.
- Establish RHR flow with E12-F003B closed and E12-F048B open.

**Task: Startup Shutdown Cooling B**

Notes: (Notes to Evaluator)

1. All controls will be from panels P601 and P680 in the Main Control Room.
2. Unless otherwise indicated, all valves are in the "E12" system.

Task Overview: (Detailed description of task)

This task places the RHR system in service for Shutdown Cooling using the normal (E12-F053B) flow path. This is a Tech Spec Decay Heat Removal method. Throttling of RHR Shutdown Cooling flow caused damage to RHR Instrumentation piping during RF12.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-E12-2 step 4.2.2c(12)

* **OPEN OR CHECK OPEN** the following valves:

F010 (Concurrent Verification Required)

* F008

* F009

* F006B

F047B

F048B

Standard: Open or Check open valves, observing red lights on and green lights off. For E12-F048B observe valve position indication is at 100%.

Cue: If asked, concurrent verification of E12-F010 was performed.

Notes: E12-F008, E12-F009 and E12-F006B need to be operated. The remaining valves are already open and need only observe indication as such.

SAT / UNSAT

Step 2: 04-1-01-E12-2 step 4.2.2c(13)
<input type="checkbox"/> * <u>CLOSE F003B, RHR HX B OUTL VLV.</u>
Standard: Close valve, observing valve position indication moves to 0%.
Cue:
Notes:
SAT / UNSAT

Step 3: 04-1-01-E12-2 step 4.2.2c(14)
<input type="checkbox"/> <u>CLOSE OR CHECK CLOSED B21-F065B, FW INL SHUTOFF VLV.</u>
Standard: <u>See Cue and Notes below.</u> Check valve closed, observing red light off and green light on.
Cue: Inform the operator as the ACRO that B21-F065B is closed.
Notes: Be mindful of other JPMs occurring in the simulator not to compromise exam security.
SAT / UNSAT

Step 4: 04-1-01-E12-2 step 4.2.2c(17)

- * **START RHR PMP B AND IMMEDIATELY FULLY OPEN one of the following valves:**
- * **E12-F053B, RHR B SHUTDN CLNG RTN TO FW.**

Standard: Starts RHR pump and opens E12-F053B, observing red lights on and green lights off.

Cue: This completes the JPM.

Notes: This step offers three valves to open. E12-F037B and E12-F042B are the wrong valves and should not be operated. Steps 4.2.2c(15-16) are NA since the operator will be using option 1 from the note prior to 4.2.2c(15).

SAT / UNSAT

Task Standard(s):

Shutdown Cooling B is started IAW SOI 04-1-01-E12-2.

SAT / UNSAT

Give this page to the student

Initial Condition(s):

- RHR B was previously in service for Shutdown Cooling but was secured.
- Radiation Protection and Chemistry personnel have been notified of the startup of RHR 'B' Shutdown Cooling.

Simulator Setup/Required Plant Conditions:

- Reset to any IC other than Refuel (IC 3)
- Lower Suppression Pool Level to 18.1 feet.
- Set the following annunciators to card pulled:
 - P680-4A2-A-6
 - P680-4A2-C-7
 - P680-4A2-D-6
 - P601-16A-C-5
 - P601-21A-C-5

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- Suppression Pool Level has dropped to 18.13 feet and is continuing to lower due to a leak in the RHR A Pump Room.
- Repairs to the leaking pipe are in progress.
- Emergency Procedure EP-3 has been entered.

Initiating Cue(s):

- The CRS directs you to manually initiate both divisions of Suppression Pool Make Up to raise Suppression Pool Water Level.

Task: Manually Initiate Suppression Pool Make Up

Notes: (Notes to Evaluator)

1. All Control Room operations will be on panel P870.

Task Overview: (Detailed description of task)

This task is to manually initiate Suppression Pool Make Up per directions from EOP-2 Containment Control. This is done per 04-1-01-E30-1 Attachment V from the Control Room to raise Suppression Pool Water Level.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-E30-1 Att. V Division 1
<input type="checkbox"/> Place the SPMU MODE SEL handswitch to AUTO
<u>Standard:</u> Verifies that the mode switch is in AUTO.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 2: 04-1-01-E30-1 Att. V Division 1
<input type="checkbox"/> * <u>Place the SPMU DUMP TEST handswitch to TEST.</u>
<u>Standard:</u> Place switch in test, observing amber light above switch on.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 3: 04-1-01-E30-1 Att. V Division 1
<input type="checkbox"/> * <u>Simultaneously depress both SPMU MAN INIT pushbuttons.</u>
<u>Standard:</u> Place switch in test, observing amber light above switch on.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 1: 04-1-01-E30-1 Att. V Division 2
<input type="checkbox"/> Place the SPMU MODE SEL handswitch to AUTO
<u>Standard:</u> Verifies that the mode switch is in AUTO.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 2: 04-1-01-E30-1 Att. V Division 2
<input type="checkbox"/> * <i>Place the SPMU DUMP TEST handswitch to TEST.</i>
<u>Standard:</u> Place switch in test, observing amber light above switch on.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 3: 04-1-01-E30-1 Att. V Division 2

* *Simultaneously depress both SPMU MAN INIT pushbuttons.*

Standard: Place switch in test, observing amber light above switch on.

Cue: **This ends the task.**

Notes:

SAT / UNSAT

Task Standard(s):

Suppression Pool Make Up Valves E30-F001A & B and E30-F002A & B are open in accordance with 04-1-01-E12-2 attachment V.

SAT / UNSAT

Task: Manually Initiate Suppression Pool Make Up

Task: Reactor Manual Scram Switch Test

Setting: Simulator
Type: RO
Task: CRO-C71-OFFNORM-005
K&A: 212000: A2.03 – 3.3/3.5
Safety Function: 7, Instrumentation
Time Required: 15 minutes
Time Critical: No
Faulted: Yes
Performance: Actual
Reference(s): 06-OP-1C71-W-0001
Handout(s): Copy of 06-OP-1C71-W-0001
Manipulations: 5
Critical Steps: 4
Group: 1

Simulator Setup/Required Plant Conditions:

- Load any 100% IC (prefer IC 31)
- Open and Run schedule file GJPM-OPS-2011CR7

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The plant is operating at rated power.

Initiating Cue(s):

- The CRS has directed you to perform 06-OP-1C71-W-0001.
- All prerequisites are verified met.
- Start with Data Sheet 1 and go in order through Data Sheet 4.
- This task is not time critical.

Task: Reactor Manual Scram Switch Test

Notes: (Notes to Evaluator)

- The task is complete when: Reactor core flow is lowered to 67 mlbm/hr and the operator determines the reactor is operating in the Monitored Region of the Power to Flow Map.

Task Overview: (Detailed description of task)

- The operator will perform 06-OP-1C71-W-0001 (Reactor Manual Scram Switch Test).
- When the operator depresses the first manual scram switch, two control rods (08-41 and 24-49) will scram due to a blown pilot solenoid fuse on the individual HCU units.
- The operator should recognize two scrambled rods and lower core flow to 67 mlbm/hr and plot reactor power and core flow on the Power to Flow Map.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 06-OP-1C71-W-0001 step 5.1	
<input type="checkbox"/>	OBTAIN Shift Supervision's permission to start. Performer to RECORD Test Start Time on Data Package Cover Sheet.
<u>Standard:</u>	Records the start time on the Surveillance Cover Sheet.
<u>Cue:</u>	If the operator asks permission to begin the surveillance, inform the operator that the CRS has given permission to begin.
<u>Notes:</u>	
SAT / UNSAT	

Step 2: 06-OP-1C71-W-0001 Data Sheet 1 step 5.2

- VERIFY** the following lights are ON to ensure that **NO** RPS trip signals are present:
 - RPS DIV 1 SCRAM SOL VLV 1A **AND** 1B lights ON (5C1)
 - RPS DIV 2 SCRAM SOL VLV 2A **AND** 2B lights ON (7C1)
 - RPS DIV 3 SCRAM SOL VLV 3A **AND** 3B lights ON (5C1)
 - RPS DIV 4 SCRAM SOL VLV 4A **AND** 4B lights ON (7C1)

Standard: Observes white scram solenoid valve lights lit.

Cue:

Notes:

SAT / UNSAT

Step 3: 06-OP-1C71-W-0001 Data Sheet 1 step 5.3

- * **ARM the Div 1 MAN SCRAM Switch (5C1) by rotating the collar clockwise.**
 - VERIFY alarm RPS MAN SWITCH PERM is received (5A-B3) RPS MAN SWITCH SCRAM PERM alarm is ON

Standard: Rotates switch collar.

Cue:

Notes:

SAT / UNSAT

Step 4: 06-OP-1C71-W-0001 Data Sheet 1 step 5.4

<input type="checkbox"/> * <i>Depress the MAN SCRAM Switch which was previously Armed.</i>	
<u>Standard:</u>	Depress MAN SCRAM Switch.
<u>Cue:</u>	
<u>Notes:</u>	When the manual scram switch is depressed, two control rods will scram.
SAT / UNSAT	

Step 5: 06-OP-1C71-W-0001 Data Sheet 1 step 5.5

<input type="checkbox"/> VERIFY the following:	
<input type="checkbox"/>	RPS SCRAM SOL VLVs lights 1A, 3A, on (5C1) AND 2A, 4A on (7C1) are OFF
<input type="checkbox"/>	RPS SCRAM SOL VLVs lights 1B, 3B, on (5C1) AND 2B, 4B on (7C1) are ON
<input type="checkbox"/>	RX SCRAM TRIP alarm is received (7A-A2)
<input type="checkbox"/>	RX MAN SCRAM TRIP alarm is received (7A-A3)

<u>Standard:</u> Observes indications listed.
<u>Cue:</u>
<u>Notes:</u>
SAT / UNSAT

Step 6: 06-OP-1C71-W-0001 Data Sheet 1 step 5.5.4
<input type="checkbox"/> * <u>Depress pushbutton SCRAM VLV (6C) AND VERIFY that NO scram valves are Open, as indicated by a green LED being OFF for all CRD/HCU's on the rod display map (6D) that are NOT tagged out.</u>
<u>Standard:</u> Determines that two Control have scrambled.
<u>Cue:</u>
<u>Notes:</u> Control Rods 08-41 and 24-49 have scrambled. Once the operator determines that rods have scrambled the operator should enter the Control Rod/Drive Malfunctions ONEP.
SAT / UNSAT

Step 7: Control Rod/Drive Malfunctions ONEP step 2.4
<input type="checkbox"/> * <u>Reduce Reactor core flow to 67 mlbm/hr.</u>
<u>Standard:</u> Lowers core flow using both Recirc flow control valves in fast detent to 67 mlbm/hr (02-S-01-27 6.5.6).
<u>Cue:</u>

Notes:

SAT / UNSAT

Step 8: Operation's Philosophy step 6.6.7

- Plot reactor power and core flow on the Power to Flow Map.

Standard: Plots power and flow.

Cue: This completes the task.

Notes:

SAT / UNSAT

Task Standard(s):

Reactor core flow is lowered to 67 mlbm/hr and the operator determines the reactor is operating in the Monitored Region of the Power to Flow Map per 05-1-02-IV-1.

SAT / UNSAT

Task: Reactor Manual Scram Switch Test

Follow-Up Questions & Answers:

Comments:

Give this page to the student

Initial Condition(s):

- The plant is operating at rated power.

Initiating Cue(s):

- The CRS has directed you to perform 06-OP-1C71-W-0001.
- All prerequisites are verified met.
- Start with Data Sheet 1 and go in order through Data Sheet 4.
- This task is not time critical.

Task: **Rotate CCW Pumps**

Setting: Simulator
Type: RO
Task: CRO-P42-007; CRO-P42-004
K&A: 400000 2.1.30: 3.9/3.4; 2.1.31: 4.2/3.9; A4.01: 3.1/3.0; A2.01: 3.3/3.4

Safety Function: Plant Service Systems (8)
Time Required: 10 minutes
Time Critical: No
Faulted: **YES**
Performance: Perform
Reference(s): SOI 04-1-01-P42-1 section 5.2; ONEP 05-1-02-V-1 section 3.1.1
Handout(s): SOI 04-1-01-P42-1; ONEP 05-1-02-V-1
Manipulations: 4
Critical Steps: 4
Group #: 2

Simulator Setup/Required Plant Conditions:

- Initialize the simulator to any IC (IC-43).
- Insert Malfunction **p42151c** CCW Pump C Trip on a unique trigger number (event 1).
- Ensure CCW Pumps 'A' and 'C' are operating with CCW Pump 'B' in Standby.

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- Electrical Maintenance has requested Component Cooling Water (CCW) Pump A be secured in preparation for preventive maintenance.
- CCW Pumps A and C are currently in operation.

Initiating Cue(s):

- The CRS directs you to rotate CCW pumps to have CCW Pumps B and C operating, with CCW Pump A secured, per SOI 04-1-01-P42-1 section 5.2.
- An operator is standing by at the CCW pumps ready to rotate pumps.

Task: Rotate CCW Pumps

Notes: (Notes to Evaluator)

Task Overview: (Detailed description of task)

This task is to rotate CCW Pumps per SOI. During the evolution, a trip will occur on one of the operating CCW pumps requiring the restart of the non-operating CCW pump per the Loss of CCW ONEP. This is an Alternate Path JPM. This is a task that is coordinated from the control room.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-P42-1 step 5.2.2a
<input type="checkbox"/> REMOVE Standby pump from STANDBY by PLACING respective pump handswitch listed below to STOP.
<u>Standard:</u> Places CCW pump B HS to STOP.
<u>Cue:</u>
<u>Notes:</u> Step 5.2.1 prerequisites are met.
SAT / UNSAT

Step 2: 04-1-01-P42-1 step 5.2.2b
<input type="checkbox"/> * AFTER white STANDBY light for pump goes out, <u>START CCW pump using its respective handswitch listed in Step 5.2.2a.</u>
<u>Standard:</u> Starts CCW pump B.
<u>Cue:</u> If asked to perform pre-start pump checks, report that pre-start pump check is performed sat.

<u>Notes:</u>
SAT / UNSAT

Step 3: 04-1-01-P42-1 step 5.2.2c
<input type="checkbox"/> CLOSE discharge valve for pump to be shut down.
<u>Standard:</u> Contacts local operator to close P42-F016A CCW pump A discharge valve.
<u>Cue:</u> Report as local operator P42-F016A is closed.
<u>Notes:</u>
SAT / UNSAT

Step 4: 04-1-01-P42-1 step 5.2.2d
<input type="checkbox"/> * <i>STOP CCW pump to be placed in STANDBY using its respective handswitch listed in Step 5.2.2a.</i>
<u>Standard:</u> Stops CCW pump A.
<u>Cue:</u> After the trip annunciator comes into alarm, inform the operator as the local operator that a small amount of water is spraying from the CCW C pump seal. CCW pump B and C are getting wet. The CRS directs you to take Immediate and Subsequent actions per the loss of CCW ONEP. If the operator attempts to go to the P680, inform the operator that another operator will perform actions at the P680.

Notes: When the operator stops CCW pump A, CCW pump C will trip causing a partial loss of CCW flow.

Simulator Operator, Trip CCW pump C when the CCW pump A has been secured.

SAT / UNSAT

Step 5: 05-1-02-V-1 Loss of CCW ONEP step 3.1.1

* Contact the local operator to open P42-F016A CCW Pump 'A' discharge valve.

Standard: Contacts local operator to open P42-F016A.

Cue: CCW Pump 'A' discharge valve P42-F016A is open.

Notes: There are no required immediate actions for the Loss of CCW ONEP. Do **NOT** allow the operator to scram the reactor!

This task is not critical if P42-F016A was not previously closed. Step 5 &6 can be done in either order.

SAT / UNSAT

Step 6: 05-1-02-V-1 Loss of CCW ONEP step 3.1.1

* **START CCW pump A.**

Standard: Start CCW pump A.

Cue: Terminate the JPM

Notes: Once the operator moves beyond step 3.1.1 "Verify standby CCW pump starts or start manually" end the JPM.

<u># Critical Steps:</u>	16
<u>Group:</u>	1

Simulator Setup/Required Plant Conditions:

- Reset to any IC with **no** SGTS initiation signal
- Insert Malfunction **rm157o** and **rm157n**, once actions have gone to completion delete the malfunctions.
- Perform the following on P870-2B, 2C to place SGTS A in Standby Mode:
 - **PLACE** SGTS DIV 1 MODE SEL handswitch on (P870-2B) to STBY position.
 - **TURN** SGTS DIV 1 MAN INIT RESET key-locked handswitch to RESET position and back to NORM, to reset automatic or manual initiation signal.
 - **PLACE** handswitch for ENCL BLDG RECIRC FAN A(B) to STOP.
 - **PLACE** handswitch for SGTS FLTR TR A(B) EXH FAN to STOP.
- Silence and acknowledge alarms after annunciator SGTS DIV 2 OPER (P870-8A-A3) has alarmed.

Safety Concerns:

- None

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The plant is at rated power.
- Standby Gas Treatment Systems A and B automatically initiated due to a momentary spike of Fuel Pool Sweep Exhaust Radiation monitors during movement of spent LPRMs on the refuel floor.
- The initiating condition is now clear, Fuel Pool Sweep Exhaust Radiation levels are normal.
- SGTS A has been placed in Standby Mode using its mode selector switch in accordance with 04-1-01-T48-1 step 5.2.2e.
- SGTS B is operating.
- Jumpers have **not** been installed to enable restarting Auxiliary Building fan coil units.

Initiating Cue(s):

- The SRO with the Command Function has directed you to shutdown the system, returning SGTS A and B to normal alignment, in accordance with 04-1-01-T48-1 section 5.3.
- Another operator will pick up at step 5.3.2p and restart normal ventilation system fans.

Task: Secure SGTS with One Train in Standby Mode following Automatic Initiation

Notes: (Notes to Evaluator)

1. All controls will be from panel P870.

Task Overview: (Detailed description of task)

- This task secures SGTS B following automatic initiation and reopens ventilation system isolation valves. SGTS A has already been secured to Standby Mode as an initial condition.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-T48-1 step 5.3.2b
<input type="checkbox"/> PLACE SGTS DIV 1(2) MOV TEST switch (P870-2B) in TEST. <input type="checkbox"/> VERIFY annunciator "SGTS DIV 1(2) MOVS IN TEST MODE" is Alarmed. <input type="checkbox"/> VERIFY SGTS D1(D2) MOV IN TEST STATUS light is on.
<u>Standard:</u> Place SGTS Div 2 MOV TEST switch in TEST.
<u>Cue:</u>
<u>Notes:</u> Step 5.3.1 prerequisites are met and 5.3.2a is NA.
SAT / UNSAT

Step 2: 04-1-01-T48-1 step 5.3.2c

PLACE the following handswitches to STOP on 1H13P842:

Standard: Request the following handswitches be placed in STOP on 1H13P842:

- T42C002A FHA EXH FAN A
- T42C004A POOL SWP EXH FAN A
- T42C002A FHA EXH FAN B
- T42C004B POOL SWP EXH FAN B
- T42C001A FHA SPLY FAN A
- T42C003A FP SWP SPLY FAN A
- T42C001B FHA SPLY FAN B
- T42C003B FP SWP SPLY FAN B

Cue: **Another operator has placed the handswitches in STOP.**

Notes: **The P842 is not modeled in the simulator.**

SAT / UNSAT

Step 3: 04-1-01-T48-1 step 5.3.2d

* ***IF one SGTS train is in standby, THEN PERFORM the follow:***

- * **PLACE SGTS DIV 1(2) MODE SEL key locked handswitch for Standby filter train to AUTO position.**
- VERIFY** SGTS DIV 1(2) MODE SEL handswitch white light is lit.
- VERIFY** SGTS DIV 1(2) IN STBY MODE annunciator clears.

Standard: Place SSTS Div 2 MODE SEL switch in AUTO.

Cue:

Notes:

SAT / UNSAT

Step 4: 04-1-01-T48-1 step 5.3.2e-f

- * ***Turn SGTS DIV 1(2) MAN INIT RESET key locked handswitch to RESET position and back to NORM, to reset automatic or manual initiation signal.***
- VERIFY** annunciator "SGTS DIV 1(2) OPER" clears.

Standard: Resets SGTS Div 2 initiation logic.

Cue:

Notes:

SAT / UNSAT

Step 5: 04-1-01-T48-1 step 5.3.2g

- * ***Place handswitch for SGTS FLTR TR A(B) EXH FAN to STOP.***

Standard: Stops SGTS B filter train exhaust fan.

Cue:

Notes:

SAT / UNSAT

Step 6: 04-1-01-T48-1 step 5.3.2h

- * ***Place*** handswitch for ENCL BLDG RECIRC FAN A(B) to STOP.

Standard: Stops SGTS B enclosure building recirc fan.

Cue:

Notes:

SAT / UNSAT

Step 7: 04-1-01-T48-1 step 5.3.2i

- OBSERVE** filter train chart recorders deenergize and Enclosure Building pressure chart recorders transfer to slow speed.

Standard: Verify chart recorders operate correctly.

Cue:

Notes:

SAT / UNSAT

Step 8: 04-1-01-T48-1 step 5.3.2j

VERIFY that all SGTS A(B) dampers on 1H13-P870-2C(8C), are CLOSED.

Standard: Verify SGTS Div 2 dampers close.

Cue:

Notes: **Damper numbers: T48-F002,3,5,8,10,12,14,16,18,20, and 22.**

SAT / UNSAT

Step 9: 04-1-01-T48-1 step 5.3.2k

VERIFY "FLTR TR A(B) EXH FAN INL VANE" on 1H13-P870-2C(8C) is OPEN.

Standard: Verify SGTS Div 2 exhaust fan inlet vane opens.

Cue:

Notes:

SAT / UNSAT

Step 10: 04-1-01-T48-1 step 5.3.2l

RECORD stop time(s) in the Accumulative Log Book.

Standard:

Cue: **Another operator will complete log book entry.**

Notes: Accumulative Log Book is kept at SM desk in the control room and is not modeled in the simulator.

SAT / UNSAT

Step 11: 04-1-01-T48-1 step 5.3.2m

- PLACE** SGTS DIV 1(2) MOV TEST switch in NORM.
- VERIFY** annunciator “SGTS DIV 1(2) MOVS IN TEST MODE” is clear.
- VERIFY** SGTS D1(D2) MOV IN TEST STATUS light is off.

Standard: Place MOV TEST switch to NORM.

Cue:

Notes:

SAT / UNSAT

Step 12: 04-1-01-T48-1 step 5.3.2n

* ***IF SGTS A was secured, THEN OPEN the following dampers:***

- * 1T42F011 * 1T42F019 * 1T42F004
- * 1M41F008 * 1M41F036 * 1T42F007

Standard: Open dampers.

Cue:

Notes: Dampers located on P870-2C

SAT / UNSAT

Step 13: 04-1-01-T48-1 step 5.3.2o

* ***IF SGTS B was secured, THEN OPEN the following dampers:***

* 1T42F012

* 1T42F020

* 1T42F003

* 1M41F007

* 1M41F037

* 1T42F006

Standard: Open dampers.

Cue: When complete, End of JPM.

Notes: Dampers located on P870-8C

K&A: 295015 AA1.01: 3.8/3.9
Safety Function: 1 – Reactivity Control
Time Required: 20 minutes
Time Critical: No
Faulted: No
Performance: Simulate
Reference(s): 05-S-01-EP-1/Att. 23
Handout(s): Copy of EOP Att. 23
Manipulations: 5
Critical Steps: 6
Group #: 1

Simulator Setup/Required Plant Conditions:

- Containment HCU floor at Area 11, 135' is accessible

Safety Concerns:

- Wear appropriate personal protective equipment.
- Don't forget ALARA
- No climbing. Point up or down while you explain what you are going to do.

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- EOP's have been entered.

Initiating Cue(s):

- The CRS directs you to perform steps 2.1 through 2.4 of EP Attachment 23.
- Another operator will complete the remaining steps of this attachment when directed.

Task: Manually Vent the SCRAM Air Header

Notes: (Notes to Evaluator)

1. This task is performed on the HCU floor in Containment, EI. 135'.
2. The valves and pipe plugs are located just south and west of the Hydraulic Control Station, near the Backup Scram Valves.

Task Overview: (Detailed description of task)

- This task provides an alternate method of venting the scram air header to allow control rod insertion. The task consists of physically removing of pipe plugs located on the scram air header using a hack saw, allowing the scram air header to depressurize. The scram pilot valves would fail open due to a loss of air pressure, allowing the control rods to insert into the reactor.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: EOP Att. 23 step 2.1	
<input type="checkbox"/> *	<u><i>OBTAIN tools from the Control Room emergency locker.</i></u>
<u>Standard:</u>	Verbalizes that the EP kit for Att. 23 is in the Control Room.
<u>Cue:</u>	You have the hacksaw from the EP Att. 23 kit.
<u>Notes:</u>	In order to meet the critical task, the operator need only verbalize that he has/would obtain a hack saw.
SAT / UNSAT	

Step 2: EOP Att. 23 step 2.2
<input type="checkbox"/> * <u>CLOSE</u> <i>1C11-F095, SCRAM VLV PILOT AIR HDR ISOL (Containment Elev 135 ft, to right of Backup Scram valves).</i>
<u>Standard:</u> Simulate turning CW to close.
<u>Cue:</u> Resistance is felt in the CW direction.
<u>Notes:</u>
SAT / UNSAT

Step 3: EOP Att. 23 step 2.3
<input type="checkbox"/> * <u>CUT OFF</u> <i>test connection cap downstream of 1C11-F307, PI-R013 test connection (above AND to left of Backup Scram valves).</i>
<u>Standard:</u> Simulate cutting off test connection.
<u>Cue:</u> Test connection cap is cut off.
<u>Notes:</u>
SAT / UNSAT

Step 4: EOP Att. 23 step 2.3.1
<input type="checkbox"/> * <u>OPEN</u> <i>1C11-F307</i>
<u>Standard:</u> Simulate turning CCW to open.
<u>Cue:</u> Resistance is felt in the CCW direction.
<u>Notes:</u>

SAT / UNSAT

Step 5: EOP Att. 23 step 2.4

* ***CUT OFF*** test connection cap downstream of 1C11-F309, PT-N052 test connection (above AND to left of Backup Scram valves).

Standard: Simulate cutting off test connection.

Cue: **Test connection cap is cut off.**

Notes:

SAT / UNSAT

Step 6: EOP Att. 23 step 2.4.1

* ***OPEN*** 1C11-F309

Standard: Simulate turning CCW to open.

Cue: **Resistance is felt in the CCW direction.**

Notes:

SAT / UNSAT

Task Standard(s):

Steps 2.1 through 2.4 of EOP Att. 23 are completed in accordance with the procedure.

SAT / UNSAT

Give this page to the student

Initial Condition(s):

- EOP's have been entered.

Initiating Cue(s):

- The CRS directs you to perform steps 2.1 through 2.4 of EP Attachment 23.
- Another operator will complete the remaining steps of this attachment when directed.

Safety Concerns:

- **Do NOT operate plant equipment.**
- For Protected Train concerns, use either RHR A or B using Attachment VIII or IX.
- **Write in on the Initial Conditions Page which RHR and Attachment is to be used.**

JOB PERFORMANCE
MEASURE

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

- The Control Room has been evacuated due to noxious fumes.
- Control of the plant has been established at the Remote Shutdown Panels.
- An SRO is controlling operations at the remote shutdown panel.
- Another operator is assigned for radio communications and is monitoring reactor level and pressure.
- A Plant Shutdown Operator is stationed in the Auxiliary Building if needed.
- The RSD room cabinet at the remote shutdown panel is unlocked.
- The reactor is shutdown
- RPV water level is within band of +30 to -30" on wide range level.
- RPV pressure is within band of 900 to 1000 psig.
- RHR Transfer switches have been placed in EMERG position per step 3.6 of the Shutdown from the Remote Shutdown Panel ONEP.
- Standby Service Water A and B are not running and are in Standby lineup per the P41 SOI.
- RCIC will be started after RHR A or B is placed in suppression pool cooling mode.

Initiating Cue(s):

- You have been directed to place RHR ____ in Suppression Pool Cooling per Attachment ____ of the Shutdown from the Remote Shutdown Panel ONEP.
- Establish maximum cooling.

Task: Startup RHR in Suppression Pool Cooling from the Remote Shutdown Panels

Notes: (Notes to Evaluator)

1. Remote Shutdown Panels are located on the 111' elevation of the Control Building.
2. Division 1 Remote Shutdown Panel is H22-P150.
3. Division 2 Remote Shutdown Panel is H22-P151.
4. This JPM may be performed using RHR A or B for protected train concerns.
5. Be sure a non-protected train ESF inverter is selected and recorded on the initiating cues page.

Task Overview: (Detailed description of task)

This task is to startup RHR A or B in Suppression Pool Cooling from the Remote Shutdown Panels per the ONEP. This includes starting up SSW A or B.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 05-1-02-II1 3.9.1(2)a1	
<input type="checkbox"/> ENSURE SSW System A(B) in operation, supplying RHR A heat exchangers. <u>IF</u> SSW A is <u>NOT</u> supplying RHR A heat exchangers, <u>THEN START</u> SSW A [SSD] as follows:	
<input type="checkbox"/> CHECK OPEN/OPEN P41-F068A(B) SSW OUTL FM RHR HX A(B) VLV.	
<u>Standard:</u>	Checks open P41-F068A(B)
<u>Cue:</u>	Red light on, green light off.
<u>Notes:</u>	If step 3.9.1(2)a is not performed, the SSW system will automatically startup and lineup when the RHR pump is started.
SAT / UNSAT	

Step 2: 05-1-02-II1 3.9.1(2)a2
<input type="checkbox"/> START P41-C001A(B), SSW PMP A(B).
<u>Standard:</u> Starts SSW pump
<u>Cue:</u> Red light on, green light off.
<u>Notes:</u>
SAT / UNSAT

Step 3: 05-1-02-II1 3.9.1(2)a3
<input type="checkbox"/> OPEN P41-F001A(B) SSW PMP A(B) DISCH VLV.
<u>Standard:</u> Open valve.
<u>Cue:</u> Red light on, green light off.
<u>Notes:</u>
SAT / UNSAT

Step 4: 05-1-02-II1 3.9.1(2)a4
<input type="checkbox"/> OPEN P41-F014A(B) SSW INL TO RHR HX A(B) VLV.
<u>Standard:</u> Open valve.
<u>Cue:</u> Red light on, green light off.
<u>Notes:</u>
SAT / UNSAT

Step 5: 05-1-02-II1 3.9.1(2)a5
<input type="checkbox"/> OPEN P41-F005A(B) SSW Loop A(B) RTN TO CLG TWR A(B).
<u>Standard:</u> Open valve.
<u>Cue:</u> Red light on, green light off.
<u>Notes:</u>
SAT / UNSAT

Step 6: 05-1-02-II1 3.9.1(2)a6
<input type="checkbox"/> VERIFY CLOSED/CLOSE P41-F006A(B) SSW Loop A(B) RECIRC VLV.
<u>Standard:</u> Verify closed valve.
<u>Cue:</u> Green light on, red light off.
<u>Notes:</u>
SAT / UNSAT

Step 7: 05-1-02-II1 3.9.1(2)a7
<input type="checkbox"/> START P41-C003A(C), SSW CLG TWR FAN A(C) AND P41-C003B(D) SSW CLG TWR FAN B(D)
<u>Standard:</u> Start Fans.
<u>Cue:</u> Red light on, green light off.
<u>Notes:</u>
SAT / UNSAT

Step 8: 05-1-02-II1 3.9.1(2)b
<input type="checkbox"/> OPEN OR CHECK OPEN the following valves: <input type="checkbox"/> E12-F004A(B) RHR PUMP A(B) SUCT FM SUPP POOL <input type="checkbox"/> E12-F047A(B) RHR HX A(B) INL VLV <input type="checkbox"/> E12-F003A(B) RHR HX A(B) OUTL VLV
Standard: Checks valves open.
Cue: For all valves, Red light on, green light off.
Notes:
SAT / UNSAT

Step 9: 05-1-02-II1 3.9.1(2)c
<input type="checkbox"/> * <u>CLOSE E12-F048A(B) RHR HX A(B) BYP VLV</u>
Standard: Close valve.
Cue: Green light on, red light off.
Notes: Throttle valve, takes 1-2 minutes to stroke. To maintain maximum cooling (as discussed in initiating cues) this valve must remain shut; therefore, 3.9.1(2)f and 3.9.1(2)g are NA.
SAT / UNSAT

Step 10: 05-1-02-II1 3.9.1(2)d
<input type="checkbox"/> * <i>START E12-C002A(B), RHR PMP A(B)</i>
<u>Standard:</u> Start pump.
<u>Cue:</u> Red light on, Green light off.
<u>Notes:</u>
SAT / UNSAT

Step 11: 05-1-02-II1 3.9.1(2)e
<input type="checkbox"/> * <i>OPEN E12-F024A(B) RHR A(B) TEST RTN TO SUPP POOL</i>
<u>Standard:</u> Open valve.
<u>Cue:</u> Red light on, Green light off. This completes the task.
<u>Notes:</u>
SAT / UNSAT

<u>Task Standard(s):</u>
RHR A(B) is operating in Suppression Pool Cooling with E12-F048 A(B) full closed and E12-F003 A(B) full open and SSW A(B) in service to the RHR A(B) Heat Exchangers.
SAT / UNSAT

Reference(s): 04-1-01-L62-1, Static Inverter SOI
Handout(s): 04-1-01-L62-1, Static Inverter SOI including Attachment III
Manipulations: 4
Critical Steps: 4
Group #: 1

Simulator Setup/Required Plant Conditions:

- Area 25A, elevation 111' is accessible
- Shift Manager/CRS permission to conduct JPM's.
- **Write in on the Initial Conditions Page which INVERTER is to be started.**

Safety Concerns:

- Wear appropriate personal protective equipment.
- Do NOT operate plant equipment.
- This JPM can be performed on any of 4 ESF inverters, ensure the inverter chosen for this JPM is not part of the protected train.

Name: _____ Time Start: _____ Time Stop: _____

Initial Condition(s):

All of the following conditions apply to inverter 1Y_____

- Inverter is shutdown with both Battery Input Breaker CB1 and Inverter Output Breaker CB2 Open.
- The Heater breaker is off.
- The Alternate Source is supplying loads (Alternate Source Breaker Closed).
- DC Bus is energized with the inverter battery feeder breaker closed.
- The Manual Bypass Switch is selected to Alternate Source to Load.

Initiating Cue(s):

- The CRS directs you to startup Inverter 1Y_____ and transfer the loads to the normal source per SOI 04-1-01-L62-1 section 4.2.

Task: Startup an ESF Static Inverter

Notes: (Notes to Evaluator)

1. Be sure a non-protected train ESF inverter is selected and recorded on the initiating cues page.

Task Overview: (Detailed description of task)

This task is to startup an ESF Static Inverter and transfer loads to the inverter per the SOI.

Tasks: Critical tasks are underlined, italicized, and denoted by an (*)

Step 1: 04-1-01-L62-1 Step 4.2.2d
<p><input type="checkbox"/>* <u>CLOSE BATTERY INPUT</u> circuit breaker on 1Y87 (1Y88, 1Y95, 1Y96) AND CHECK the following:</p> <ul style="list-style-type: none"><input type="checkbox"/> DC input voltmeter reads approximately 105 to 140 volts.<input type="checkbox"/> Inverter AC output frequency is reading 60 hertz \pm 0.1 hertz.<input type="checkbox"/> INVERTER OUTPUT UNDERVOLTAGE Red indicating light is Off.<input type="checkbox"/> INVERTER CURRENT LIMIT Red indicating light is Off.<input type="checkbox"/> INVERTER OVERHEATING Red indicating light is Off.<input type="checkbox"/> IN SYNC Amber indicating light is On (delayed).<input type="checkbox"/> FAN FAILURE Red indicating light is On.
<p><u>Standard:</u> Close CB1, Battery input breaker.</p>
<p><u>Cue:</u> DC input voltage and AC frequency are as indicated on the inverter, all other indications are as indicated by the procedure.</p>

Notes: Step 4.2.2a instructs the operator to move to step 4.2.2d. The inverter will remain in Alternate Supplying Load until the last step where the Inverter to Load pushbutton is depressed.

SAT / UNSAT

Step 2: 04-1-01-L62-1 Step 4.2.2e

* **CLOSE** *Inverter Output circuit breaker on 1Y87 (1Y88, 1Y95, 1Y96).*

Standard: Close CB2, Inverter output breaker.

Cue:

Notes: **Closing this breaker does not change indications on the inverter.**

SAT / UNSAT

Step 3: 04-1-01-L62-1 Step 4.2.2f

CHECK IN SYNC light is On; **IF** OUT OF SYNC light is On, **THEN CONTACT** Electrical and **DO NOT** proceed until IN SYNC light is On. There is some time delay to achieve the IN SYNC light.

Standard: Checks IN SYNC light lit.

Cue: **IN SYNC light is on.**

Notes:

SAT / UNSAT

Step 4: 04-1-01-L62-1 Step 4.2.2g

* ***IF IN SYNC light is On, Perform the following:***

* ***TRANSFER Manual Bypass switch to NORMAL OPERATION position***

ALTERNATE SOURCE AVAILABLE (Amber) - On

ALTERNATE SOURCE POWERING LOAD (Red) - On

Standard: Places Manual Bypass switch to NORMAL OPERATION

Cue: **Alternate source available and powering load lights are on.**

Notes:

SAT / UNSAT

Step 5: 04-1-01-L62-1 Step 4.2.2h

* **DEPRESS INVERTER TO LOAD pushbutton AND CHECK** following indications:

- INVERTER POWERING LOAD Amber light is On.
- BATTERY NEAR EXHAUSTION light - Off
- INVERTER CURRENT LIMIT light – Off
- FAN FAILURE - Off
- INVERTER OVERHEATING light - Off
- INVERTER OUTPUT UNDERVOLTAGE light – Off
- INVERTER POWERING LOAD light - On
- In SYNC light - On
- System AC output (volts) - approximately 120 Vac \pm 5 volts
- Inverter AC output (hertz) - 60 hertz \pm 0.1 hertz

Standard: Depress inverter to load pushbutton.

Cue: If the inverter is already supplying the load, then indications are as seen on the inverter.

Otherwise, system AC output is 120 VAC/60 Hz with all other indications as indicated by the procedure.

This completes the JPM.

Notes:

SAT / UNSAT

Task Standard(s):

Inverter is started and supplying the load per 04-1-01-L62-1 section 4.2.

Facility: Grand Gulf Nuclear Station Scenario No.: 1 Op-Test No.: 12/11

Examiners: _____ Operators: _____

Objectives: To evaluate the candidates' ability to operate the facility in response to the following evolutions:

1. Inoperable Primary Containment Air Lock
2. Rotate CRD Pumps.
3. Respond to a CRD Pump Trip.
4. Lower reactor power using Recirc Flow Control.
5. Respond to a Recirc Pump Trip.
6. Respond to ST-11 and 15AA lockout.
7. Take actions for RPS fails to scram.
8. Take actions for an ATWS.
9. Respond to a FW Line A Break in the Drywell.

Initial Conditions: Operating at 100% power.

Inoperable Equipment: None

Turnover:

The plant is at rated power. Rotate CRD pumps in accordance with the C11-1 SOI in preparation for CRD pump "A" maintenance. There is no out of service equipment and EOOS is GREEN. It is a division 1 work week.

Scenario Notes:

This scenario was written from lesson plan GSMS-RO-EP033 revision 6. Attributes have been altered in order to meet the requirements of NUREG 1021 ES-301 section D.5.b, and is considered significantly modified.

Validation Time: 60 minutes

Event No.	Malf. No.	Event Type †	Event Description
1		TS (CRS)	Primary Containment Air Lock seal fails to inflate (TS 3.6.1.2)

Simulator Setup:

A. Initialization

1. Log off all simulator PDS and SPDS computers (PDS and SPDS must come up after the simulator load for proper operation).
2. Startup the simulator using Simulator Instructor's Job Aid section 6.3.

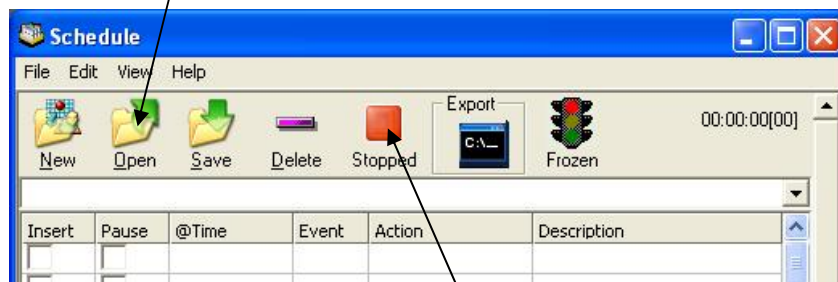

Note:

Prior to running the Schedule File, ensure no Event Files are Open. If an existing Event File is Open prior to running the Schedule File, then any associated Event Files will not automatically load.

3. Open Schedule.exe and Director.exe by clicking on the Icon in the Thunder Bar.

4. Set the Simulator to **IC-31** and perform switch check (Using Quick Reset in Director).
5. Click on **“Open”** in the Schedule window and Open Schedule File **“2011 NRC Scenario 1.sch”** (in the Schedule Directory)

6. In Schedule window, click on the **“Stopped”** red block. The red block will change to a green arrow and indicate the scenario is active (**“Running”**).

- Click the Summary tab in the Director window. Verify the schedule files are loaded and opened per Section B below. (Note: Any actions in the schedule file without a specific time will not load into the director until triggered.)

- Take the simulator out of freeze.
- Log on to all simulator PDS and SPDS computers.
- Verify or perform the following:
 - IC-31
 - APRM's are turned on (4,1,2,3)
 - Ensure the correct rod movement sequence available at the P680.
 - Advance all chart recorders and ensure all pens inking properly.
 - Clear any graphs and trends off of SPDS.
- Run through any alarms and ensure alarms are on. (**Note: On T-Rex, to verify alarms are ON, the indicator will indicate "Alarms On"**).
- Place the simulator in Freeze.

B. File loaded verification:

Ready NUM

The screenshot shows the Director - Dev Load:1962 software interface. At the top, there is a menu bar with 'File', 'View', and 'Help'. Below the menu bar is a row of 30 numbered buttons (1-30) in green boxes. A toolbar contains icons for 'Summary', 'Malfunctions', 'Remotes', 'Overrides', 'Modify', 'Details', 'Event', 'Page Up', 'Page Down', 'Frozen', and 'Quick Reset'. A search bar is labeled 'Search Keywords' and includes a checkbox for 'Match whole words only'. The 'Sim. Time' is displayed as '00:00:0'. Below the toolbar is a table with the following data:

Key	Description	T...	Delay	Inserted	Ramp	Final	Value
c71076	Fail to Scram (Manual Scram Op...		00:00:00		00:00:00	Active	InActive
c11164	CRD HYDRAULIC BLOCK		00:00:00		00:00:00	10	0
e51044	RCIC Turbine Speed Control Fail...		00:00:00		00:00:00	0	0

The status bar at the bottom left shows 'Ready' and the bottom right shows 'NUM'.

Crew Turnover:

A. Assign the candidates crew positions.

B. Turnover the following conditions:

Power	100%
Pressure	1025 psig
BOC	
EOOS	GREEN

Planned Evolutions this shift:

- Mechanical will be performing maintenance on CRD pump “A” later this shift. Rotate CRD pumps per the C11-1 SOI when you take the shift.
- Note that an independent Reactivity Management SRO per Operations Philosophy 6.8.1 will not be provided for this scenario.

C. Allow the crew to perform pre-shift brief and review procedures for planned evolutions.

D. Bring the crew into the Simulator, place the simulator is in RUN.

E. Allow the crew to walk down panels.

F. When the crew assumes the shift begin Scenario Activities.

SCENARIO ACTIVITIES:

- A. Start SBT report and any other required recording devices (Video recording not allowed for NRC exams).

Rotate CRD Pumps (Normal)/Containment door seal failure(tech spec call only):

- B. The crew will start CRD pump B and stop CRD pump A using 04-1-01-C11-1, Control Rod Drive Hydraulic System SOI.
1. When directed by the Control Room to perform pre-pump start checks:
 - a. Report that CRD pump “B” oil sump, motor and gearbox oil levels are normal and pre-pump start check is complete.
 2. When directed by the Control Room to CLOSE C11-F217B:
 - a. Wait 30 seconds then report to the Control Room “C11-F217B is closed.”
 3. When directed to vent CRD pump “B” by opening then closing C11-F109B:
 - a. Wait 30 seconds then report “C11-F109B was cycled open then shut. CRD pump B is vented.”
 4. When directed by the Control Room to OPEN C11-F217B:
 - a. Wait 45 seconds then report to the Control Room “C11-F217B is open.”
 - b. *Call the Control Room and report as the Aux Building Rover that you were unable to get the seal to inflate for the Aux Building door Air Lock on 119’ elevation.*
 - c. *The CRS will enter TS 3.6.1.2 condition A.*
 - d. *If directed by the CRS, report that Containment door in the 119’ elevation Air Lock is closed with the seal inflated.*
 5. When directed by the Control Room to CLOSE C11-F217A:
 - a. Wait 30 seconds then report to the Control Room “C11-F217A is closed.”
 6. When directed by the Control Room to OPEN C11-F217A:
 - a. Wait 45 seconds then report to the Control Room “C11-F217A is open.”
 7. When directed by the Control Room to Check CRD purge flows are 1.5 to 2.5 gpm on C11-FI-R020A & B:
 - a. Report to the Control Room that CRD purge flows are 2 gpm on both CRD pumps.

CRD Pump Trip (Control Rod/Drive Malfunctions ONEP):

- C. CRD pump “B” will trip 2 minutes after CRD pump “A” is stopped (Auto Event 5).
- D. The crew will take Immediate Operator Action per CRD malfunctions ONEP to restart CRD pump A.
- E. If asked as the local operator to investigate the pump trip, wait 3 minutes and report back to the Control Room that CRD pump “B” breaker 152-1605 tripped on over current. If sent to the pump to investigate, report that CRD pump “B” is hotter than normal and is not running.
- F. Give the crew time to allow them to perform a transient brief before moving to the next step.

Reduce reactor power using FCVs (Normal/Reactivity):

- G. Call the control room as the Shift Manager and direct the CRS to lower generator output by 200 MWe for a temporary down power requested by the Load Dispatcher. All notifications have been made.
 - 1. The crew will lower power using 03-1-01-2, Power Operations IOI, Attachment VIII.

Recirc Pump Trip (Reduction in Recirc ONEP):

- H. When generator output is below 1275 MWe, Auto Event 8 will cause Recirc Pump “A” to trip.
 - 1. The crew will take actions for Reduction in Recirc Flow Rate ONEP (THI watch, one Recirc pump stopped, and Exit Restricted Region).
 - 2. The CRS will determine that TR 3.4.1 requires setpoints of TR 3.3.2.1 to be implemented. This must be completed in 12 hours. The CRS will contact Reactor Engineering or I&C to implement the new setpoints.

SCRAM/FW Line Rupture/ATWS:

- I. When the Restricted Region is exited and the CRS has determined the need to implement single loop setpoints, and the lead evaluator is ready to move on, trigger **Event 10** to insert malfunctions r2133a and r21139e to cause a lockout on Service Transformer 11 and 15AA. (**Install EP Attachments as directed**).
 - 1. With no Recirc Pumps running, the reactor will enter the Exclusion Region of the power to flow map. An automatic scrams are disabled; therefore, the ACRO must manually insert a scram.
 - 2. The BOP will reenergize 12HE and 13AD with the Alternate Feeder Breakers.

3. When directed by the control room, trigger **EVENT 11** to reset Under Voltage Lockouts on 12HE and 13AD. Wait 3 minutes to report that the lockouts were reset.
4. When the ACRO inserts a scram, the leak on the "A" FW line (fw171a) will be inserted after a 7 minute delay. This will prevent using Feed and Condensate to feed the reactor.
5. When the CRS directs Attachment 12 to be installed, install attachment 12 as "Done." Wait until reactor level is below -160" and then take the attachment paperwork to the CRS and report that attachment 12 is installed with the exception of B21-F065A being closed.

Termination:

- J. Once emergency depressurization has been conducted and reactor water level is stabilized above TAF, using RHR B E12-F053B, or as directed by Lead Evaluator:
- Take the simulator to Freeze and turn horns off.
 - Stop and save the SBT report and any other recording devices.
 - Instruct the crew to not erase any markings or talk about the scenario until after follow-up questions are asked.

Critical Tasks:

- Second Recirculation pump trips. Crew inserts manual reactor scram as observed by control rods inserted and scram annunciators received. Criterion is to give the highest priority to insert a manual scram.
- When EP-2A requires Emergency Depressurization, Crew terminates and prevents all injection except boron, CRD, and RCIC per 02-S-01-27 Operations Philosophy. Feedwater and ECCS system alignments prevent injection into the RPV as evidenced by available instrumentation. Criterion is to give the highest priority to prevent all injection except boron, CRD, and RCIC until reaching MSCP.
- Reactor pressure decreases to MSCP. Crew commences and slowly raises injection utilizing available EP-2A Table 4 and/or Table 5 systems with RPV level restored and maintained to greater than -191". Criterion is to give the highest priority to restore RPV level greater than -191".

Emergency Classification:

Site Area Emergency on SS3 and FS1

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>1</u>
Event Description: <u>Inoperable Primary Containment Air Lock</u>			
TIME	Position	Applicant's Actions or Behavior	
	CRS	When the Auxiliary Building Rover reports that the Containment air lock on the 119' elevation fails to inflate: Declares Primary Containment Air Lock on 199' elevation INOPERABLE and enters TS 3.6.1.2 Condition A.	

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>2</u>
Event Description: <u>Rotate CRD Pumps</u>			
TIME	Position	Applicant's Actions or Behavior	
	CRS	Directs the BOP to Rotate CRD pumps in accordance with SOI 04-1-01-C11-1.	
	BOP	<p>Rotates CRD pumps using SOI 04-1-01-C11-1 section 5.5:</p> <ul style="list-style-type: none"> • Notifies the local operator to perform pump pre-start checks. • Notifies the local operator to CLOSE C11-F217B. (step 5.5.2a) • Notifies the local operator to cycle OPEN and SHUT C11-F109B to vent CRD pump B. (step 5.5.2b) • Starts CRD pump B. (The BOP should alert the ACRO that he is starting the CRD B pump) • Notifies the local operator to SLOWLY OPEN C11-F217B. • Check CRD system flow has stabilized between 54 to 66 gpm. • Notifies the local operator to CLOSE C11-F217A. • Stops CRD pump A. • Notifies the local operator to OPEN C11-F217A. • Check CRD system flow is between 54 to 66 gpm. • Notifies the local operator to check CRD purge flows are 1.5 to 2.5 gpm on C11-FI-R020A & B. • Check that Reactor Recirculation Seal pressure has not changed. 	

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>3</u>
Event Description: <u>CRD Pump Trip</u>			
TIME	Position	Applicant's Actions or Behavior	
	BOP	<p>Recognizes and reports that CRD Pump B has tripped off.</p> <ul style="list-style-type: none"> ❖ As indicated by annunciator P601-22A-C-3, CRD PMP A/B AUTO TRIP and P601-22A-A-3, CRD CHRG WTR PRESS LO. 	
	CRS	<p>Enters the CRD Malfunctions ONEP.</p> <p>Ensures immediate actions for CRD pump trip are performed.</p>	
	ACRO	<p>Monitor for HCU faults.</p>	
	BOP	<p>Take immediate operator actions per CRD malfunctions ONEP (from memory).</p> <ul style="list-style-type: none"> • Place CRD SYS FLO CONT (C11-R600 on P601-22B) in MANUAL and REDUCE output to zero. • Start CRD pump A. • Slowly adjust CRD SYS FLO CONT to 54-66 gpm after charging pressure returns to normal. (~1700 psig) • Return CRD SYS FLO CONT to AUTO with tapeset at 54-66 gpm. <p>THERE ARE NO REQUIRED SUBSEQUENT ACTIONS FOR THIS EVENT</p>	
	CREW	<p>Ensure that an operator or electrician is sent to investigate the cause of the pump trip.</p>	

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>4</u>
Event Description: <u>Lower Generator Output 200 MWe</u>			
TIME	Position	Applicant's Actions or Behavior	
	CRS	<p>Conducts reactivity brief for the planned power reduction. Power Reduction is per IOI-2 attachment VIII.</p> <p>Directs the ACRO to lower reactor power using the Recirc FCV's in slow detent.</p> <p>Directs the BOP to maintain Load Demand +/- 25 MW of Load Demand Limited.</p>	
	ACRO	<p>Lowers power by closing the Recirc FCVs A & B using loop flow controllers B33K603A & B in slow detent on P680-3B (IOI-2 attachment VIII step 12.3).</p>	
	BOP	<p>Lowers Load Demand as power is reduced by depressing EHC LOAD REF DEMAND LOWER pushbutton (P680-9C) to maintain generator actual load within +/- 25 MW of the load demand limited value during power reduction (IOI-2 attachment VIII step 12.2).</p>	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>1</u> Event No: <u>5</u>		
Event Description: <u>Recirc Pump Trip</u>		
	ACRO	Recognizes and reports that Recirc Pump A has tripped off. ❖ As indicated by annunciator P680-3A-B-4, RECIRC PMP A OVERLD/TRIP
	CRS	Enters the Reduction in Recirculation ONEP.
	ACRO	Reports Entry into the Restricted Region of the power to flow map. Establishes THI watch without concurrent duties.
	CRS	Directs the BOP to Close the B33-F067A (Recirc Pump A discharge valve).
	BOP	Shuts B33-F067A (P680-3C).
	CRS	Initiate actions to exit the Restricted Region by either opening Recirc FCV B or inserting CRAM rods. Conducts reactivity brief for unplanned power change.
	BOP	Exits the Restricted Region by either opening Recirc FCV B or inserting CRAM rods as directed by the CRS.
	ACRO	Peer checks the BOP if CRAM rods are inserted.
	CRS	Once the Restricted Region is exited, direct the following actions (per the Reduction in Recirc ONEP subsequent actions): <ul style="list-style-type: none"> • Ensure the operating Recirc Loop flow is <44,600gpm. • Re-open B33-F067A after it is closed for 5 minutes. • Open the Recirc "A" FCV to the maximum position. • Per TS 3.4.1, TR 3.4.1 and Reduction in Recirc ONEP, determine and inform the Reactor Engineer or I&C that Single Loop setpoints must be established within 12 hours from the time single loop operation was entered and surveillance 06-RE-1J11-V-001 must be performed. <p>The CRS will not have time to address each of these actions since the scenario will move forward once the Restricted Region is exited and need for single loop setpoints is identified per the requirements of TR 3.4.1.</p>

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>6</u>
Event Description: <u>Lockout on ST11 and 15AA</u>			
TIME	Position	Applicant's Actions or Behavior	
	BOP	<p>Recognizes and reports to the CRS a lockout on ST11.</p> <ul style="list-style-type: none"> ❖ As indicated by annunciators P807-2A-A-4/5, SVC XFMR 11 PRI/SEC LOCKOUT TRIP. ❖ The ST11 lockout will cause a loss of the remaining Recirc pump <p>Takes Immediate Actions for Loss of AC Power.</p> <ul style="list-style-type: none"> • Re-energizes the 12HE and 13AD busses using the Alternate Feeders (P807-1C/2C). • Directs the local operator to RESET under voltage lockouts on 13AD and 12HE busses. 	
	CRS / BOP	<p>Ensure that Electrical Maintenance is dispatched to recover the 15AA bus.</p>	
	CRS	<p>Enters the Loss of AC Power ONEP.</p> <p>Ensures immediate actions for Loss of AC Power ONEP are performed.</p> <ul style="list-style-type: none"> • Ensure 12HE and 13AD are reenergized. 	

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>7</u>
Event Description: <u>Failure of RPS to Scram</u>			
TIME	Position	Applicant's Actions or Behavior	
	ACRO	<p>* Second Recirculation pump trips. Crew inserts manual reactor scram as observed by control rods inserted and scram annunciators received. Criterion is to give the highest priority to insert a manual scram. (The RPS automatic scram has been disabled)</p> <p>Report to CRS that he is placing the Mode SW in SHUTDOWN.</p> <p>Place the Mode SW to SHUTDOWN.</p> <p>Provides a scram report:</p> <ul style="list-style-type: none"> • Reactor Mode SW in SHUTDOWN. • All Rods are NOT Inserted (Hyd Block ATWS). • Reactor power is below 4%. • Reactor water level and trend. • Reactor pressure and trend. • Feedwater is recoverable (but will be lost when the MSIV's close on loss of air to containment). • Bypass valves are available. 	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>1</u> Event No: <u>8</u>		
Event Description: <u>ATWS</u>		
	CRS	Enter the SCRAM ONEP and the Turbine and Generator Trips ONEP. Enter EP-2, when ATWS is discovered Enter EP-2A.
	CRS	Direct actions of EP-2A steps 1 - 4: <ul style="list-style-type: none"> • Directs ACRO to Verify Recirc Pumps transferred to LFMG. • Directs ACRO to Verify ARI/RPT initiation. • Directs BOP to inhibit ADS. • Directs BOP to Override HPCS injection.
	ACRO	Verify Recirc Pumps transferred to LFMG. Verify/Initiate ARI/RPT.
	BOP	Inhibits ADS. <ul style="list-style-type: none"> • Place ADS "A" and ADS "B" keylock switches to "INHIBIT" Override HPCS injection. <ul style="list-style-type: none"> • Place the HPCS pump handswitch to the "STOP" position. • Place the E22-F004, HPCS injection valve, handswitch to the "CLOSE" position.
	CRS	Direct the ACRO or BOP to verify Division 3 generator running with cooling water and that Isolations for Reactor Level 2 are completed.
	ACRO / BOP	Verify Division 3 Diesel Generator is running with cooling water. Isolations for Reactor Level 2 are completed.
	CRS	Enter EP-2A step L-6 or L-7 and direct the ACRO to establish level band -70 to -130" (The CRS may initially establish a band of 11.4 to 53.5", but since the ATWS is producing significant heat, he should opt to lower level to lower power and may override Low Pressure ECCS systems). Enter EP-2A step P-4 and direct the BOP to establish a pressure band 800 – 1060 psig using IPC and BCV Manual Jack (The CRS may establish a pressure band of 450 – 600 psig when the MSIV's close and the Feed pumps subsequently trip). Call for EP Attachments 8, 12, 18, 19, 20, and 28 (only attachment 12b and 28 will be useful, the CRS may opt to only call for these attachments).

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>8 cont.</u>
Event Description: <u>ATWS</u>			
	BOP	<p>If directed by the CRS,</p> <p>Reduce reactor pressure using IPC (by depressing the “PRESS REF LOWER” PB) and BCV Manual Jack (by depressing the “MAN BYP ON/OFF” PB and then the “MAN BYP CONT LOWER” PB) to pressure band 450 – 600 psig.</p>	
	ACRO	<p>Line up Feed and Condensate systems for Startup Level Control using hard card.</p> <ul style="list-style-type: none"> • If two Feed pumps are running, trip one. • Close N21-F009A and N21-F009B. • Open N21-F001, N21-F010A and N21-F010B. • Verify Closed N21-F513, N21-F510, N21-F040. • If no Feed pumps are in operation, start one. <ul style="list-style-type: none"> ○ Ensure RFPT A(B) controls “Manual” pushbutton is backlit. ○ Verify AC lube oil pump is running ○ Open N21-F014A(B) ○ Depress the TRIP RESET pushbutton ○ Depress the RAISE pushbutton to establish Feed pump discharge pressure above reactor pressure by approx. 250 psig. • Open/Verify Open N21-F014A or N21-F014B • Maintain reactor level in Auto or Manual using the Startup level controller or Manually using N21-F040 or N21-F009A(B). <p>Feed the reactor using the Startup Level Controller to maintain reactor level within the set level band (11.4 to 53.5” or -70 to -130”).</p>	

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>9</u>
Event Description: <u>Feedwater Line A rupture in the Drywell</u>			
TIME	Position	Applicant's Actions or Behavior	
	ACRO	<p>Recognize symptoms of a FW Line A rupture in the Drywell.</p> <ul style="list-style-type: none"> ❖ As indicated by uneven feed flow to the reactor between the "A" and "B" feed water lines. ❖ Also indicated by rising DW pressure and temperature. <p>Report the Feed water leak to the CRS.</p> <p>Trip all condensate pumps. (This is necessary to stop the leak in the drywell since the feed water line isolations to the reactor have lost power, N21-F065A and N21-F065B.)</p>	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>1</u> Event No: <u>8 cont.</u>		
Event Description: <u>ATWS</u>		
	ACRO	Keep CRS updated with reactor level as it trends down (following the loss of feed).
	CRS	When EP Attachment 12 is installed or reactor level reaches -191", Exit Level and Pressure Legs of EP-2A and Enter Emergency Depressurization. * When EP-2A requires Emergency Depressurization, Crew terminates and prevents all injection except boron, CRD, and RCIC per 02-S-01-27 Operations Philosophy. Feedwater and ECCS system alignments prevent injection into the RPV as evidenced by available instrumentation. Criterion is to give the highest priority to prevent all injection except boron, CRD, and RCIC until reaching MSCP.
	CRS	Verify SP level is above 10.5 ft. Direct the BOP or ACRO operator to verify/perform Terminate and Prevent injection into the RPV by overriding low pressure systems (LPCS/LPCI) Direct BOP to Open 8 ADS valves.
	ACRO / BOP	When directed, Terminate and Prevent injection into the RPV. <ul style="list-style-type: none"> • Verify HPCS is initiated with annunciators P601-16A-B-5, HPCS MTR CONT MAN OVERRD, and P601-16A-D-5, HPCS INJ VLV F004 MAN OVERRD in. • Verify/perform low pressure ECCS systems overridden by ensuring division 2 ECCS initiation signal is present and placing the LPCI B and C pump hand switches to off and placing the E12-F042B and C handswitches to CLOSE. <ul style="list-style-type: none"> ○ This is verified by annunciators P601-17A-B-1, RHR INJ VLV F042B MAN OVERRD, P601-17A-C-2, RHR PMP B MAN OVERRD, P601-17A-B-4, RHR INJ VLV F042C MAN OVERRD, and P601-17A-C-5, RHR PMP C MAN OVERRD in.
	BOP	Opens at least 7 ADS valves.

Op-Test No: <u>12/11</u>		Scenario No: <u>1</u>	Event No: <u>9 cont.</u>
Event Description: <u>ATWS</u>			
	CRS	Enter EP-2A step L-10 (following the Emergency Depressurization). Establish reactor pressure as critical parameter for the ACRO.	
	ACRO	Keep CRS updated with reactor pressure as it trends down.	
	CRS	<p>When reactor pressure is below MSCP (219 psig) direct ACRO to feed the reactor using RHR B via the E12-F053B with 4000 gpm and then at intervals of 1000 gpm until reactor level begins to trend up.</p> <p>* Reactor pressure decreases to MSCP. Crew commences and slowly raises injection utilizing available EP-2A Table 4 and/or Table 5 systems with RPV level restored and maintained to greater than -191". Criterion is to give the highest priority to restore RPV level greater than -191".</p> <p>Enter EP-2A step L-6 or L-7 and establish level band -70 to -130".</p>	
	CRS	Enter EP-3 on Suppression Pool Temperature and Drywell pressure; however, no substantial operator actions are expected for this entry during the scenario.	

Give this page to the CRS

Turnover the following conditions:

Power	100%
Pressure	1025 psig
BOC	
EOOS	GREEN

Planned Evolutions this shift:

- Mechanical will be performing maintenance on CRD pump “A” later this shift.
Rotate CRD pumps per the C11-1 SOI when you take the shift.
- Note that an independent Reactivity Management SRO per Operations Philosophy 6.8.1 will not be provided for this scenario.

Facility: Grand Gulf Nuclear Station Scenario No.: 2 Op-Test No.: 12/11

Examiners: _____ Operators: _____

Objectives: To evaluate the candidates' ability to operate the facility in response to the following evolutions:

1. Place SSW "A" in STANDBY.
2. Raise reactor power using Recirc Flow Control.
3. RPS "A" MG failure.
4. Electric Power Monitoring Assembly INOPERABLE.
5. Two APRM channel failures.
6. Fuel cladding leak.
7. RCIC fails to start on initiation.
8. RCIC room unisolable steam leak.

Initial Conditions: Operating at 85% power.

Inoperable Equipment: APRM "F" is failed downscale and bypassed.

Turnover:

A plant startup is in progress with all steps complete up to step 6.8 of Attachment II in 03-1-01-2 (Power Ascension From 60% to Full Power). The crew will place SSW "A" in STANDBY upon assuming the shift. When SSW "A" is in STANDBY, raise reactor power to 100% of rated.

Scenario Notes:

This scenario was written from lesson plan GSMS-RO-EP015 rev. 8. Attributes have been altered in order to meet the requirements of NUREG 1021 ES-301 section D.5.b, but is not considered significantly modified.

Validation Time: 50 minutes

Event No.	Malf. No.	Event Type †	Event Description
1	p41f005a_i	C (BOP)	Place SSW "A" in Standby (SOI 04-1-01-P41-1 section 4.6)
2		N (BOP) R (ACRO)	Raise Reactor power using FCV's (IOI 03-1-01-2 Att. 2 step 6.8)
3	c71077a	C (BOP) A (CREW)	RPS "A" MG failure (Loss of One or Both RPS Buses (05-1-02-III-2) ONEP)
4		TS (CRS)	Electric Power Monitoring Assembly INOPERABLE (TS 3.3.8.2)
5	c51010f c51010d	I (ACRO) TS (CRS) A (CREW)	Two APRM channel failures (ARI/TS 3.3.1.1)
6	rr071 rm157a rrd21k648a_d rrd21k648b_d rrd21k648c_d rrd21k648d_d	M (CREW) R (ACRO)	Fuel cladding leak (Off-Gas Activity High (05-1-02-II-2) and SCRAM (05-1-02-I-1) ONEP) * Fuel failure is occurring and main steam line radiation is greater than 3 times normal full power background as indicated by MSL B / MSL C RAD HI-HI or MSL A / MSL D RAD HI-HI alarms, the crew closes MSIVs and MSL drains per EP-4. The crew closes the MSIVs and MSL drains and observes valve position indications and lowering pressure trend downstream of the MSIVs. Criterion is to give the highest priority to close the four inboard MSIVs or the four outboard MSIVs and MSL drains when MSL radiation is greater than 3 times normal full power background.
7	e51043 DI_1E51M625D	I (ACRO / BOP)	RCIC fails to start on initiation (SOI 04-1-01-E51-1)

8	e51187a e51187b rrd21k603 rrd21k613	M (CREW) I/C (ACRO / BOP)	RCIC room unisolable steam leak (EP-4) * A primary system is discharging outside primary containment and area temperatures, radiation levels, or water levels are above their max safe values in two or more areas. The crew opens 8 ADS/SRVs and observes lowering pressure trend and valve position indications (tailpipe pressure indication lamps or solenoid valve energized). Criterion is to give the highest priority to open at least seven SRVs when area temperatures, radiation levels, or water levels are above their maximum safe values in two or more areas.

Simulator Setup:

A. Initialization

1. Log off all simulator PDS and SPDS computers (PDS and SPDS must come up after the simulator load for proper operation).
2. Startup the simulator using Simulator Instructor's Job Aid section 6.3.

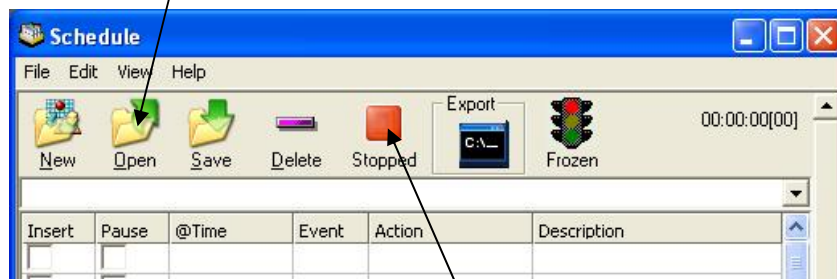

Note:

Prior to running the Schedule File, ensure no Event Files are Open. If an existing Event File is Open prior to running the Schedule File, then any associated Event Files will not automatically load.

3. Open Schedule.exe and Director.exe by clicking on the Icon in the Thunder Bar.

4. Set the Simulator to **IC-33** and perform switch check (Using Quick Reset in Director).
5. Click on **“Open”** in the Schedule window and Open Schedule File **“2011 NRC Scenario 2.sch”** (in the Schedule Directory)

6. In Schedule window, click on the **“Stopped”** red block. The red block will change to a green arrow and indicate the scenario is active (**“Running”**).

- Click the Summary tab in the Director window. Verify the schedule files are loaded and opened per Section B below. (Note: Any actions in the schedule file without a specific time will not load into the director until triggered.)

- Take the simulator out of freeze.
 - Log on to all simulator PDS and SPDS computers.
 - Verify or perform the following:
 - IC-33
 - SSW "A" started normally.
 - After SSW "A" is running, trigger event 30 to setup malfunction p41f005a_c (thermal ol/49 device)
 - APRM "F" is bypassed and caution tagged
 - APRM's are turned on (4,1,2,3)
 - Ensure the correct rod movement sequence available at the P680.
 - Advance all chart recorders and ensure all pens inking properly.
 - Clear any graphs and trends off of SPDS.
 - Run through any alarms and ensure alarms are on. (**Note: On T-Rex, to verify alarms are ON, the indicator will indicate "Alarms On"**).
 - Place the simulator in Freeze.
- B. File loaded verification:

			29	Insert malfunction p41f005a_c after 10 on event 29	override (thermal ol/49 device)

The screenshot shows the Director - Dev Load:1962 software interface. At the top, there is a menu bar with 'File', 'View', and 'Help'. Below the menu bar is a row of 30 numbered buttons (1-30). A toolbar contains icons for 'Summary', 'Malfunctions', 'Remotes', 'Overrides', 'Modify', 'Details', 'Event', 'Page Up', 'Page Down', 'Frozen', and 'Quick Reset'. A search field labeled 'Search Keywords:' is present, along with a checkbox for 'Match whole words only' and a 'Sim. Time:' display showing '00:00:00'. The main area features a table with the following data:

Key	Description	T...	Delay	Inserted	Ramp	Final	Value
e51187a	E51F063 POWER LOSS ON STR...		00:00:00		00:00:00	Active	InActive
c51010f	APRM Channel F Downscale		00:00:00		00:00:00	Active	InActive
e51043	RCIC Auto Start Failure		00:00:00		00:00:00	Active	InActive
DI_1E5...	P601/218 RCIC MAN INIT DEPRS		00:00:00		00:00:00	NORM	NORM

The status bar at the bottom shows 'Ready' and a 'NUM' indicator.

Crew Turnover:

A. Assign the candidates crew positions.

B. Turnover the following conditions:

Power	85%
Pressure	1010 psig
BOC	
EOOS	GREEN

- A reactor startup is in progress with all steps complete up to step 6.8, Attachment II of 03-1-01-2 (Power Ascension from 60% to full power)
- SSW “A” is in service.
- APRM “F” has failed downscale and is in BYPASS (a tracking LCO was written).
- Note that an independent Reactivity Management SRO per Operations Philosophy 6.8.1.b will not be provided for this scenario.

Planned Evolutions this shift:

- Place SSW “A” in STANDBY using 04-1-01-P41-1 SSW SOI.
- Once SSW “A” is in STANDBY, continue with plant startup and raise reactor power to 100%. Ramp rates are not required until reactor power reaches 95%.

C. Allow the crew to perform pre-shift brief and review procedures for planned evolutions.

D. Bring the crew into the Simulator, place the simulator is in RUN.

E. Allow the crew to walk down panels.

F. When the crew assumes the shift begin Scenario Activities.

SCENARIO ACTIVITIES:

- A. Start SBT report and any other required recording devices (Video recording not allowed for NRC exams).

Place SSW “A” in STANDBY

- B. The crew will place SSW “A” in STANDBY.
1. When the operator attempts to close P41-F005A, it will not shut due to tripped thermal device.
 2. If directed by the control room to manually shut P41-F005A, wait 3 minutes and report that the valve is stuck and the motor is hot to the touch.
 3. If asked to check the breaker, report that the breaker is tripped and you will submit a work request to further determine the cause.
 4. When the lead evaluator is satisfied with the crew response, call the CRS (2374) and prompt the crew to go ahead and raise power.

**Raise reactor power to 100%:**

- C. The crew will raise reactor power to 100% using FCVs.
1. No operations outside the control room are required.
 2. When APRM “A” reaches 90% power, RPS “A” MG will Trip (Auto Event 1).

RPS “A” MG set failure

- D. The crew will enter the Loss of One or Both RPS Buses ONEP and:
1. Re-energize RPS “A” by placing the MG Set “A” transfer switch to Alternate “A”.
 2. Reset the Half-Scram
 3. Ensure MSIVs are open.
 - a. When the BOP comes to the booth and asks the status of the pilot solenoids amperage on the back panels, reply that all MSIVs indicate normally.
- E. When asked to investigate the cause of the bus trip, when the half-scrum is reset, inform the control room that:
1. the RPS “A” MG EPA breaker C71S003A and C71S003C (located on the Control Building, 189’ el.) are tripped and the undervoltage flags are tripped. The motor-generator is operating normally.

2. you have also noted that the alternate feeder EPA breaker C71S003G underfrequency flag is tripped, but the breaker is still closed (**ensure that the CRS understands that this is the breaker currently powering the RPS “A” Bus**).

APRM “D” fails upscale

- F. When the CRS enters LCO 3.3.8.2 Condition “A,” insert malfunction c51009d by triggering **Event 2** to cause APRM “D” to fail full scale.
1. Since APRM “F” is already in bypass, no operator action is required for this situation; however, the CRS may opt to place APRM “F” in service and bypass APRM “D” in order to clear the Half-Scram.
 2. When the CRS enters LCO 3.3.1.1 Condition “A,” insert malfunction rr071 by triggering **Event 3** to insert a Fuel Cladding Leak.

Fuel Cladding Leak

- G. When the OG PRE-TREAT RAD HI annunciator alarms, the crew will enter the Off-Gas Activity High ONEP.
1. If asked as RP to report local Pre-treat rad levels, report them as above normal and trending up.
 2. Prior to Pre-treat radiation levels reaching 1,400 mR/hr, the CRS will direct the ACRO to lower core flow to 67 mlbm/hr.
 3. When core flow is below 68.5 mlbm/hr, Auto Event 4 will trigger causing the Fuel Cladding Leak to worsen.
 - a. The crew will enter the Reduction in Recirc Flow ONEP and the ACRO will become the THI watch with concurrent duties.
 4. When the crew determines that Pre-treat radiation levels cannot be maintained below 14,000 mR/hr, the crew will manually scram the reactor and enter the Reactor Scram and Turbine Trip ONEPs and EP-2. **Insert EP Attachments as directed** by the Control Room.
 5. 15 seconds after the scram Auto Event 5 will trigger causing Condensate Pumps to trip on low condenser level (due to failed trip unit, this is unrecoverable)
 6. 2 minutes after the scram, MSL RAD HI annunciator will alarm and the CRS will enter EP-4.
 7. 4 ½ minutes after the scram, MSL A-D HI-HI annunciators will alarm. The CRS will direct the BOP operator to close all MSIVs per EP-4 step 1.

Unisolable steam leak RCIC room/RCIC fail to start on initiation

- H. After all MSIVs are closed the CRS will direct the ACRO/BOP operator to control reactor level using RCIC and HPCS.
1. The CRS should establish a reactor pressure band of 800-1060 psig using ADS/SRV valves and a reactor level band of +30" to -30".
 2. Once the operating feed pump trips, RCIC will fail to initiate (when started by the operator or on low level). The operator must manually line up RCIC.
- I. When E51-F045 opens, an unisolable steam leak will occur in the RCIC room.
1. The crew will receive RCIC room high temperature and radiation alarms. The E51-F063 and E51-F064 will fail to close (loss of power, motor pinion key failed respectively).
 2. The crew should enter the reduced pressure band 450-600 psig to reduce driving head of the steam leak.
 3. Five minutes after RCIC is started, report to the control room as Security that there is a plume of steam coming from the Auxiliary Building Roof.
 4. When 2 max safe values (Rad levels) from EP-4 Table 10 are reached, the crew will enter the emergency depressurization procedure of EP-2.

Termination:

- J. Once emergency depressurization has been conducted and reactor water level is stabilized above TAF, or as directed by Lead Evaluator:
- Take the simulator to Freeze and turn horns off.
 - Stop and save the SBT report and any other recording devices.
 - Instruct the crew to not erase any markings or talk about the scenario until after follow-up questions are asked.

Critical Tasks:

- Fuel failure is occurring and main steam line radiation is greater than 3 times normal full power background as indicated by MSL B / MSL C RAD HI-HI or MSL A / MSL D RAD HI-Hi alarms, the crew closes MSIVs and MSL drains per EP-4. The crew closes the MSIVs and MSL drains and observes valve position indications and lowering pressure trend downstream of the MSIVs. Criterion is to give the highest priority to close the four inboard MSIVs or the four outboard MSIVs and MSL drains when MSL radiation is greater than 3 times normal full power background.
- A primary system is discharging outside primary containment and area temperatures, radiation levels, or water levels are above their max safe values in two or more areas. The crew opens 8 ADS/SRVs and observes lowering pressure trend and valve position indications (tailpipe pressure indication lamps or solenoid valve energized). Criterion is to give the highest priority to open at least seven SRVs when area temperatures, radiation levels, or water levels are above their maximum safe values in two or more areas.

Emergency Classification:

Site Area Emergency FS1

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>2</u> Event No: <u>1</u>		
Event Description: <u>Place SSW "A" in Standby</u>		
	CRS	Directs the BOP operator to place SSW "A" in standby.
	BOP	<p>Places SSW "A" in Standby using SOI 04-1-01-P41-1 section 4.6:</p> <ul style="list-style-type: none"> • Verifies all prerequisites are met • N/A's steps 4.6.2a – 4.6.2h. • Places the SSW "A" MOV test switch to TEST • Open/check open P41-F006A. • Close P41-F005A – P41-F005A will fail to close <ul style="list-style-type: none"> ❖ As indicated by annunciator P870-1A-C2, SSW DIV 1 OOSVC ❖ SSW D1 MOV OVERLD PWR LOSS status light turns on <p>The operator refers to ARI for P870-1A-C2 and:</p> <p>Does not proceed with securing SSW and report that P41-F005 lost power and is still open. At this point, if the crew chooses to stop the SSW pump they will cause the SSW head tank to drain.</p> <p>Look in Attachment IIIA of 04-1-01-P41-1 and determine breaker number for P41-F005A (52-155112).</p> <p>Direct the local operator to the breaker for P41-F005A on 15B51to determine the cause of loss of power.</p> <p>Using ARI and control room indications, determine that the valve's breaker has tripped on overload.</p> <ul style="list-style-type: none"> ❖ As indicated by the SSW D1 MOV OVERLD PWR LOSS status light lit and the valve positions indicating lights for P41-F005A on the P870 are still lit. <p>Reports diagnosis to the CRS.</p>
	CRS	<p>Ensure an operator and/or electrical maintenance is dispatched to investigate the problem.</p> <p>The CRS should opt to leave SSW A running. In order to secure SSW A, P41-F005A would have to be manually closed. Without power to the valve, SSW A would have to be declared INOPERABLE.</p> <p>If the CRS declares SSW A INOPERABLE, enters TS 3.5.1 Condition A.</p>

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>2</u>
Event Description: <u>Raise reactor power using Recirc Flow Control</u>			
TIME	Position	Applicant's Actions or Behavior	
	CRS	<p>Conducts reactivity brief for the planned power change. (May be performed prior to taking the shift)</p> <p>Directs the ACRO to raise reactor power to 100% using Recirc FCV's.</p>	
	ACRO	<p>Raises power by opening the Recirc FCVs A & B using loop flow controllers B33K603A & B in slow detent on P680-3B (IOI-2 attachment VIII step 12.3).</p>	
	BOP	<p>Raises Load Demand as power is raised by depressing EHC LOAD REF DEMAND RAISE pushbutton (P680-9C) to maintain generator actual load within +/- 25 MW of the load demand limited value during power ascension (IOI-2 attachment VIII step 12.2).</p>	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>2</u> Event No: <u>3</u>		
Event Description: <u>RPS "A" MG failure</u>		
	ACRO	<p>Recognizes and reports a half-scrum with no additional annunciators and a trip of the RPS bus has occurred.</p> <ul style="list-style-type: none"> As indicated by annunciator P680-7A-A-2, RX SCRAM TRIP coupled with a ½ scram and no other indications for why the ½ scram occurred. The GENERATOR A NORMAL FEED AVAILABLE light is out on the back panel.
	CRS	<p>Enters the Loss of One or Both RPS Buses ONEP.</p> <p>Direct the BOP to re-energize the A RPS bus using the alternate power source.</p> <p>Direct the ACRO to reset the half-scrum.</p> <p>Send a local operator to investigate the cause of the RPS A MG failure.</p>
	BOP	<p>When directed, Re-energize the A RPS Bus using the Alternate power source.</p> <ul style="list-style-type: none"> Place the MG SET A TRANSFER switch on the CONTROL ROD TEST INSTRUMENT PANEL (P610) to ALT "A"
	ACRO	<p>When directed, reset the half-scrum.</p> <ul style="list-style-type: none"> Place the division 1 scram RESET switches to RESET on the P680.
	CRS	<p>Direct the BOP to ensure all MSIVs are energized.</p>
	BOP	<p>When directed, ensure all MSIV solenoid lights are on and all MSIV pilot solenoids indicate amperage on the P622 and P623 panels.</p> <p>(This is not modeled in the simulator. The operator should go to the instructor booth behind the P807 and simulate performance by stating to the instructor his intentions to perform the step. The instructor will provide the operator with a verbal cue concerning indications the operator observes).</p>

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>4</u>
Event Description: <u>Electric Power Monitoring Assembly INOPERABLE</u>			
TIME	Position	Applicant's Actions or Behavior	
	CRS	<p>Recognizes entry conditions and enters TS 3.3.8.2 Condition A.</p> <p>❖ There are no indications in the control room for the EPMA breaker failure; however, the following report will be made to the control room:</p> <p><i>When asked to investigate the cause of the bus trip, when the half-scram is reset, inform the control room that:</i></p> <ol style="list-style-type: none"> 1. <i>the RPS "A" MG EPA breaker C71S003A (located on the Control Building, 189' el.) is tripped and the undervoltage flag is tripped.</i> 2. <i>you have also noted that the <u>alternate feeder</u> EPA breaker C71S003G underfrequency flag is tripped, but the breaker is still closed (ensure that the CRS understands that this is the breaker currently powering the RPS "A" Bus).</i> 	

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>5</u>
Event Description: <u>Two APRM channel failures</u>			
TIME	Position	Applicant's Actions or Behavior	
	ACRO	<p>Recognizes and reports APRM D has failed upscale.</p> <ul style="list-style-type: none"> ❖ As indicated by annunciators P680-7A-A-2, RX SCRAM TRIP, and P680-7A-B-3, NEUTRON MON SYS TRIP ❖ APRM Ch-D will be "pegged" high and will have the UPSC ALM light on. ❖ This will also cause a ½ scram. 	
	CRS	<p>Recognizes entry conditions and enters TS 3.3.1.1 Condition A and TRM 3.1.5 Conditions A & B.</p> <p>The CRS may opt to un-bypass APRM F (failed downscale) in order to bypass APRM D (failed upscale) so that the ½ scram can be cleared. If so, the CRS will:</p> <ul style="list-style-type: none"> -Direct the ACRO to un-bypass APRM F and bypass APRM D. -Direct the ACRO to reset the ½ scram. 	
	ACRO	<p>If directed,</p> <p>Move Division 2 APRM bypass switch from CH-F to CH-D.</p> <p>Reset the ½ scram by momentarily placing the RPS DIV 2 and RPS DIV 4 SCRAM RESET switches to reset and observing that all 8 SCRAM SOL VLV lights are lit.</p> <p>Report completed actions to the CRS.</p>	

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>6</u>
Event Description: <u>Fuel Cladding Leak</u>			
TIME	Position	Applicant's Actions or Behavior	
	BOP	<p>Recognizes and reports to the CRS when the OG PRE-TREAT RAD HI annunciator alarms.</p> <p>Directs the CRS to the Off-Gas Activity High ONEP per the OG PRE-TREAT RAD HI ARI.</p>	
	CRS	<p>Enters the Off-Gas Activity High ONEP.</p> <p>Establish Off-Gas Pre-Treat Radiation Level as a critical parameter.</p>	
	ACRO / BOP	<p>Monitor Off-Gas Pre-Treat Radiation Level.</p> <p>Report Off-Gas Pre-Treat Radiation Levels as directed by the CRS.</p>	
	CRS	<p>When the CRS anticipates exceeding the limits of step 3.1 Pre-Treatment Monitor Limit (700mR/hr), directs the ACRO to lower core flow to 67 mlbm/hr in fast detent.</p>	
	ACRO	<p>Lower core flow to 67 mlbm/hr using Recirc "A" and "B" FCV flow controllers in fast detent when directed by the CRS.</p>	
	CRS	<p>Enters the Reduction in Recirculation Flow Rate ONEP.</p> <p>Ensures THI watch with concurrent duties is established.</p>	
	ACRO	<p>Plot the power to flow map.</p> <p>Recognize and report to the CRS entry into the Monitored Region as determined by the power to flow map plot.</p> <p>Establish THI watch with concurrent duties.</p>	
	CRS	<p>Perform subsequent actions of the Off-Gas Activity High ONEP.</p> <ul style="list-style-type: none"> • Consult with the Reactor Engineer or Duty Manager for further power reductions. • Activate the Emergency Plan when limits of step 3.3 are exceeded. • Notify Chemistry to monitor ventilation release points. 	
	CRS	<p>When the CRS determines that Off-Gas Pre-Treat Radiation Levels cannot be maintained below 14,000 mR/hr, direct the ACRO to scram the reactor.</p> <p>Enter the Scram ONEP, Turbine/Generator Trip ONEP, EP-2</p>	

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>6 cont.</u>
Event Description: <u>Fuel Cladding Leak</u>			
TIME	Position	Applicant's Actions or Behavior	
	ACRO	<p>Places the Reactor Mode Switch to SHUTDOWN when directed by the CRS.</p> <p>Provides a scram report:</p> <ul style="list-style-type: none"> • Reactor Mode SW in SHUTDOWN. • Reactor power is 0%. • Reactor water level and trend. • Reactor pressure and trend. • Feedwater is NOT available. • Bypass valves are available. 	
	ACRO / BOP	Start RCIC by arming and depressing the RCIC initiation push button (RCIC will fail to start; see event 7 on page 17).	
	BOP	Recognizes and reports EP-4 entry condition when MSL RAD HI annunciator alarms on P601-19A-D4.	
	CRS	Enters EP-4 when any entry condition is met.	

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>6 cont.</u>
Event Description: <u>Fuel Cladding Leak</u>			
	ACRO / BOP	Recognize and report when MSL A-D HI-HI radiation annunciators alarm. Close all MSIVs (per EP-4 step 1).	
	CRS	<p>When MSL A-D HI-HI radiation annunciators alarm, direct the ACRO/BOP to close all MSIVs.</p> <p>*Fuel failure is occurring and main steam line radiation is greater than 3 times normal full power background as indicated by MSL B / MSL C RAD HI-HI or MSL A / MSL D RAD HI-HI alarms, the crew closes MSIVs and MSL drains per EP-4. The crew closes the MSIVs and MSL drains and observes valve position indications and lowering pressure trend downstream of the MSIVs. Criterion is to give the highest priority to close the four inboard MSIVs or the four outboard MSIVs and MSL drains when MSL radiation is greater than 3 times normal full power background.</p> <p>Establish reactor pressure band of 800 – 1060 psig using ADS/SRV valves.</p> <p>Establish reactor level band of +30" to -30" using Feed and Condensate system (this band is established per Ops Philosophy Level Band Strategies since reactor pressure is now being controlled with ADS/SRV's).</p>	
	BOP	Maintain pressure band of 800 – 1060 psig using ADS/SRV valves (cycle open and closed as required to stay within band).	
	ACRO	Maintain level band of +30" to -30" using HPCS (May use the Startup Level Controller in Auto or Manual).	

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>7</u>
Event Description: <u>RCIC fails to start on initiation</u>			
TIME	Position	Applicant's Actions or Behavior	
	ACRO / BOP	<p>Recognizes that RCIC does not start when manually initiated using Initiate push button.</p> <ul style="list-style-type: none"> ❖ As indicated when nothing happens after the Initiate PB is depressed. <p>Manually starts RCIC using SOI 04-1-01-E51-1 Attachment VI.</p> <ul style="list-style-type: none"> • Shift RCIC Flo controller to manual and reduce output to minimum. • Open E51-F046. • Start Gland Seal Compressor. • Open E51-F095. • After 6 seconds, Open E51-F045. • Raise turbine speed using flow controller in manual to develop pressure greater than reactor pressure. • Open E51-F013. • Adjust flow as necessary with Flo controller. • Verify SSW A is running with adequate flow path. <p>Establish and maintain reactor water level in the established band (11.4" to 53.5")</p>	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>2</u> Event No: <u>8</u>		
Event Description: <u>RCIC room unisolable steam leak</u>		
	ACRO / BOP	<p>Recognize and report unisolable steam leak in the RCIC room after RCIC is initiated.</p> <ul style="list-style-type: none"> ❖ As indicated by annunciators P601-21A-G-3, RCIC EQUIP AREA TEMP HI, P601-21A-H-2, RCIC PIPE/EQUIP AMBIENT TEMP HI, and P601-21A-H-3, RCIC EQUIP AREA dT HI. ❖ E51-F063 loss of power and E51-F064 will not close. ❖ RCIC room temperature remains high.
	CRS	<p>Enter EP-4 at 22 (will be on step 10 until 2 max safe values are reached).</p> <p>Direct the BOP to monitor EP-4 parameters.</p>
	BOP	<p>Monitor EP-4 parameters using EP-4 table 3.</p> <ul style="list-style-type: none"> • Monitor for 2 Max Safe values
	CRS	<p>Establish a reduced pressure band of 450 – 600 psig to reduce the driving head of the steam leak in accordance with the Ops Philosophy Pressure Control Strategy.</p> <p>Establish a level band of +30" to -30" in accordance with Ops Philosophy Level Control Strategy.</p>
	BOP	<p>Control reactor pressure in the 450 – 600 psig band using ADS/SRV valves when directed.</p>
	ACRO	<p>Manually initiate HPCS to maintain reactor water level within the established band by arming and depressing the HPCS initiation pushbutton.</p>

Op-Test No: <u>12/11</u>		Scenario No: <u>2</u>	Event No: <u>8 cont</u>
Event Description: <u>RCIC room unisolable steam leak</u>			
	BOP / ACRO	Recognize and report to the CRS when 2 max safe values of EP-4 Table 10 are exceeded.	
	CRS	<p>When 2 max safe values of EP-4 Table 10 are exceeded, enters the Emergency Depressurization procedure of EP-2.</p> <p>*A primary system is discharging outside primary containment and area temperatures, radiation levels, or water levels are above their max safe values in two or more areas. The crew opens 8 ADS/SRVs and observes lowering pressure trend and valve position indications (tailpipe pressure indication lamps or solenoid valve energized). Criterion is to give the highest priority to open at least seven SRVs when area temperatures, radiation levels, or water levels are above their maximum safe values in two or more areas.</p> <ul style="list-style-type: none"> ❖ The Two Max Safe values for this scenario are: <ul style="list-style-type: none"> - SGTS Rad levels of 800 mr/hr ($\geq 8 \times 10^2$ mr/hr) - RCIC Room Rad levels of 80,000 mr/hr ($\geq 8 \times 10^4$ mr/hr) • Verify SP level is above 10.5 ft. • Direct the BOP operator to open 8 ADS valves. 	
	BOP	Opens at least 7 ADS valves when directed by the CRS.	
	ACRO	Maintain reactor level band of +30" to -30" following Emergency Depressurization. (The CRS may establish a level band of 11.4" to 53.5")	

Give this page to the CRS

Turnover the following conditions:

Power	85%
Pressure	1010 psig
BOC	
EOOS	GREEN

- A reactor startup is in progress with all steps complete up to step 6.8, Attachment II of 03-1-01-2 (Power Ascension from 60% to full power)
- SSW “A” is in service.
- APRM “F” has failed downscale and is in BYPASS (a tracking LCO was written).
- Note that an independent Reactivity Management SRO per Operations Philosophy 6.8.1.b will not be provided for this scenario.

Planned Evolutions this shift:

- Place SSW “A” in STANDBY using 04-1-01-P41-1 SSW SOI.
- Once SSW “A” is in STANDBY, continue with plant startup and raise reactor power to 100%. Ramp rates are not required until reactor power reaches 95%.

Facility: Grand Gulf Nuclear Station Scenario No.: 4 Op-Test No.: 12/11

Examiners: _____ Operators: _____

Objectives: To evaluate the candidates' ability to operate the facility in response to the following evolutions:

1. Place Suppression Pool Cooling in service.
2. Condensate Booster Pump Trip.
3. Trip of the 16BB3 electric bus.
4. Control Rod drift.
5. Second Control Rod drift.
6. Unisolable LOCA with limited injection capabilities.
7. Division 3 Diesel Generator failure to start.
8. Division 2 Diesel Generator running without cooling water.
9. Loss of power to E22-F004 HPCS injection valve.

Initial Conditions: Operating at 100% power.

Inoperable Equipment: None

Turnover:

A plant is operating at rated power. Suppression Pool temperature is elevated due to a weeping SRV. The Crew will start Suppression Pool Cooling on RHR B using the 04-1-01-E12-1 RHR system SOI.

Scenario Notes:

This is a new scenario.

Validation Time: 55 min

Simulator Setup:

A. Initialization

1. Log off all simulator PDS and SPDS computers (PDS and SPDS must come up after the simulator load for proper operation).
2. Startup the simulator using Simulator Instructor's Job Aid section 6.3.

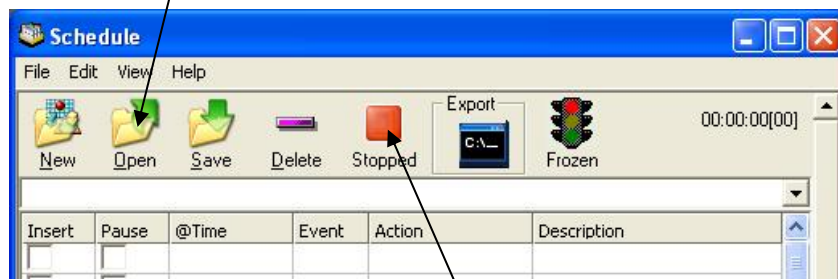

Note:

Prior to running the Schedule File, ensure no Event Files are Open. If an existing Event File is Open prior to running the Schedule File, then any associated Event Files will not automatically load.

3. Open Schedule.exe and Director.exe by clicking on the Icon in the Thunder Bar.

4. Set the Simulator to **IC-31** and perform switch check (Using Quick Reset in Director).
5. Click on **“Open”** in the Schedule window and Open Schedule File **“2011 NRC Scenario 4.sch”** (in the Schedule Directory)

6. In Schedule window, click on the **“Stopped”** red block. The red block will change to a green arrow and indicate the scenario is active (**“Running”**).

- Click the Summary tab in the Director window. Verify the schedule files are loaded and opened per Section B below. (Note: Any actions in the schedule file without a specific time will not load into the director until triggered.)

- Take the simulator out of freeze.
- Log on to all simulator PDS and SPDS computers.
- Verify or perform the following:
 - IC-31
 - APRM's are turned on (4,1,2,3)
 - Suppression Pool Temperature is 85.6F
 - Startup SSW B normally
 - Ensure the correct rod movement sequence available at the P680.
 - Advance all chart recorders and ensure all pens inking properly.
 - Clear any graphs and trends off of SPDS.
- Run through any alarms and ensure alarms are on. (**Note: On T-Rex, to verify alarms are ON, the indicator will indicate "Alarms On"**).
- Place the simulator in Freeze.

B. File loaded verification:

Ready NUM

The screenshot shows the Director - Dev Load:1962 software interface. At the top, there is a menu bar with 'File', 'View', and 'Help'. Below the menu bar is a row of 30 numbered buttons (1-30). A toolbar contains icons for 'Summary', 'Malfunctions', 'Remotes', 'Overrides', 'Modify', 'Details', 'Event', 'Page Up', 'Page Down', 'Frozen', and 'Quick Reset'. A search field labeled 'Search Keywords' is present, along with a checkbox for 'Match whole words only' and a 'Sim. Time' display showing '00:00:00'. The main area features a table with the following data:

Key	Description	T...	Delay	Inserted	Ramp	Initial	Final	Value
p41f018b_i	override (los...		00:00:00		00:00:00		Active	InActive
LO_1P41M623B_G	P870/07C S...		00:00:00		00:00:00		TRUE	TRUE

At the bottom left, the status 'Ready' is displayed. At the bottom right, there is a 'NUM' field.

Crew Turnover:

A. Assign the candidates crew positions.

B. Turnover the following conditions:

Power	100%
Pressure	1030 psig
BOC	
EOOS	GREEN

- SSW B is in service.
- Suppression Pool temperature is elevated because of a weeping SRV.

Planned Evolutions this shift:

- The Crew will place Suppression Pool Cooling in service on RHR B. Pre-start pump checks are complete for RHR B pump.

C. Allow the crew to perform pre-shift brief and review procedures for planned evolutions.

D. Bring the crew into the Simulator, place the simulator is in RUN.

E. Allow the crew to walk down panels.

F. When the crew assumes the shift begin Scenario Activities.

SCENARIO ACTIVITIES:

- A. Start SBT report and any other required recording devices (Video recording not allowed for NRC exams).

Place Suppression Pool Cooling in service on RHR B

- B. The crew will place Suppression Pool Cooling in service on RHR B using 04-1-01-E12-1.
1. If asked to perform pre-start pump checks, wait 2 minutes and report back to the Control Room that pre-start pump checks are complete.
 2. No actions outside the Control Room are required for this evolution.

Condensate Booster Pump “A” Trip

- C. When suppression pool cooling is in service, trigger **Event 1** to insert malfunction fw118a. This will cause the ‘A’ Condensate Booster Pump to trip (and RFPT suction pressures to lower to 330 psig)
1. The Crew will enter the Feedwater System Malfunctions ONEP and respond per the Condensate Booster Pump “A” ARI.
 2. If asked as the local operator to investigate the pump trip, wait 3 minutes and report back to the Control Room that the Pump Breaker is tripped.

Trip of the 16BB3 electric bus

- D. When the Crew lowers reactor power and RFPT suction pressure has returned to normal, trigger **Event 3** to insert malfunction r21142z. This will cause 16BB3 to trip on over current.
1. When directed by the Control Room to investigate breaker 52-16301, wait 2 minutes and report that the breaker has tripped on over current.
 2. When the CRS enters TS 3.6.1.3 Condition A, TS 3.5.1 Condition C, and TS 3.6.4.3 Condition A, trigger **Event 4** to insert malfunction z161161_24_33. This will cause control rod 24-33 to drift out.

Control Rod Drift

- E. The CRS will enter the Control Rod/Drive Malfunctions ONEP
1. When control rod 24-33 FH is inserted below position 8 it will become stuck (Auto trigger 5) and core flow will be lowered to 67 mlbm/hr.

2. If sent as the Aux Building Operator to isolate rod 24-33 FH by closing the 103 and 105 valve, wait 45 seconds and report that rod 24-33 FH is isolated.
3. Four minutes later, control rod 28-33 GH will begin to drift inward (Auto trigger 5). The ACRO will scram the reactor.

Unisolable LOCA with limited injection capabilities

- F. When the reactor is scrammed, Auto trigger 6 will cause the following to occur:
1. Electric bus 15AA will trip on over current.
 - a. This bus is not recoverable. When the control room sends an operator and/or an electrician to investigate, report back after 3 minutes that the bus is damaged.
 - b. If directed to place the Division 1 diesel in Maintenance Mode, coordinate with the control room and trigger **Event 9** when directed to place in maintenance mode.
 2. Division 3 Diesel Generator will fail to start.
 3. The 500KV switchyard will be lost.
 4. RHR C pump will trip.
 - a. This pump is not recoverable. When the control room sends an operator and/or an electrician to investigate breaker 152-1609, wait 3 minutes and report the beaker is tripped on thermal device.
 - b. If sent to the pump, report that it is very hot and that the motor casing is discolored.
 5. P41-F018B (SSW to Div 2 DG) will lose power on stroke.
 - a. When directed by the control room to place division 2 diesel in MAINT, coordinate with the control room and trigger **Event 8** to place the diesel in MAINT.
 6. E22-F004 (HPCS injection valve) will lose power on stroke. This valve CAN be manually opened if an operator is sent to open it.
 - a. When the control room sends an operator to open this valve, wait until RPV water level is -100" wide range, then trigger **Event 7** to manually open E22-F004. Do not report the opening of E22-F004 to the Control Room.
- G. Insert EP Attachments as requested by the Control Room.

Termination:

H. When reactor water level is stabilized in the -30 to 30" level band using HPCS, or as directed by Lead Evaluator:

- Take the simulator to Freeze and turn horns off.
- Stop and save the SBT report and any other recording devices.
- Instruct the crew to not erase any markings or talk about the scenario until after follow-up questions are asked.

Critical Tasks:

- When Division 3 Diesel Generator fails to start, the crew re-energizes the 17AC bus with an alternate feeder (ESF 12). HPCS is the only recoverable system and power to this bus is required to run the HPCS pump.
- The crew injects HPCS to the reactor before reactor water level lowers to -191".
- When E22-F004 loses power, the crew sends an operator to manually open the valve. HPCS is the only recoverable system and this valve must be manually opened in order to allow injection to the reactor. Criteria is that this valve is opened prior to reactor water level reaching -191".

Event Description: <u>Trip of the 16BB3 electric bus</u>			
TIME	Position	Applicant's Actions or Behavior	
	CRS	<p>Enters Loss of AC Power ONEP (there are no helpful actions from this ONEP).</p> <p>Ensure actions of ARI for annunciator P864-2A-E-3 are implemented.</p> <p>Ensure the BOP operator takes actions per the ARI for 480V LCC 16BB3 UNVERVOLT annunciator.</p> <p>Directs the BOP to evaluate Control Room panels to determine what equipment is affected the loss of 16BB3 (this is directed by the alarm response instruction for the loss of 16BB3).</p> <p>Directs local operator to determine the cause for the breaker trip.</p> <p>Uses SOI 04-1-01-R21-16 to determine what equipment is affected by the loss of 16BB3.</p> <p>Enters the following Tech Specs (due to the completion time constraints and expected plant response organization to this event, only the bolded TS is required for credit in this case):</p> <ul style="list-style-type: none"> • TS 3.6.1.3 Condition A (4 hr) • TS 3.6.5.3 Condition A (8 hr) • TS 3.8.7 Condition A (8 hr) • TS 3.1.7 Condition B (7 day) • TS 3.6.4.3 Condition A (7 day) • TS 3.6.3.2 Condition A (30 day) • TS 3.5.1 Condition A (previously entered) 	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>4</u> Event No: <u>4</u>		
Event Description: <u>Control Rod Drift</u>		
	ACRO	<p>Recognizes and reports that Control Rod 24-33 FH is drifting out.</p> <ul style="list-style-type: none"> ❖ As indicated by annunciator P680-4A2-E-4, CONT ROD DRIFT. ❖ The operator will depress the ROD DRIFT RC&IS push button to determine which rod is drifting. The operator will then select that control rod for display on the full core display and determine the direction of the rod drift. (This action is described in the ARI for the above annunciator) <p>Applies a continuous insert signal for control rod 24-33 FH per the Control Rod/Drive Malfunctions ONEP immediate operator actions.</p>
	CRS	<p>Enters the Control Rod/Drive Malfunctions ONEP.</p> <p>Ensures all immediate operator actions are carried out.</p>
	ACRO	<p>When Control Rod 24-33 FH becomes stuck, reduces reactor core flow to 67 mlbm/hr per the Control Rod/Drive Malfunctions ONEP immediate operator actions.</p> <p>Reset the rod drift annunciator by depressing the rod drift reset pushbutton on RC&IS (This action is described in the ARI for the CONT ROD DRIFT annunciator and is required in order to detect a second rod drift)</p>
	ACRO / BOP	<p>Plot reactor power and flow on the power to flow map after the reduction in Recirc Flow and determine entry into the Monitored Region. Set THI watch with concurrent duties.</p> <p>Report entry into the Monitored Region of the power to flow map to the CRS.</p>
	CRS	<p>Enter the Reduction in Recirc Flow ONEP.</p> <p>Direct the ACRO to monitor for THI (set THI watch with concurrent duties).</p>
	ACRO	<p>Recognize and report that a second control rod, 28-33GH, is drifting inward.</p> <ul style="list-style-type: none"> ❖ This is indicated the same as the original rod drift
	CRS	<p>Directs the ACRO to insert a manual scram (per CRD malfunctions ONEP subsequent actions).</p> <p>Enter Scram and Turbine Trip ONEPs.</p>

Op-Test No: <u>12/11</u>		Scenario No: <u>4</u>	Event No: <u>4 Cont.</u>
Event Description: <u>Control Rod Drift</u>			
		<p>When directed, inserts a manual scram by placing the Mode Switch to SHUTDOWN.</p> <p>Provides a scram report:</p> <ul style="list-style-type: none"> • Reactor Mode SW in SHUTDOWN. • Reactor power is 0%. • Reactor water level and trend. • Reactor pressure and trend. • Feedwater is available until the main turbine trips (this is when ST-11 goes away and both RFPT's lose lube oil and trip). • Bypass valves are not available. 	
	BOP / ACRO	Initiate HPCS and RCIC in anticipation of a loss of feedwater (this is part of the crew's responsibility to maintain reactor water level within the desired band and is primarily the responsibility of the ACRO).	

TIME	Position	Applicant's Actions or Behavior
Op-Test No: <u>12/11</u> Scenario No: <u>4</u> Event No: <u>5</u>		
Event Description: <u>Unisolable LOCA with limited injection capabilities</u>		
	BOP	Recognize and report 15AA bus lockout as indicated by the 4.16KV BUSS 15AA TRIP annunciator and no power to the bus. The BOP should attempt to energize the bus using the ESF 12 feeder breaker.
	CREW	Recognize and report indications of a LOCA in the Drywell as indicated by rising drywell pressure and temperature (P680-5A-C3, DRWL PRESS HI/LO; P680-5A-C2, DRWL PRESS HI HI; HPCS and ECCS initiations due to 1.39 psig in the drywell).
	CRS	Enter EP-2 and EP-3 Direct actions of EP-2: <ul style="list-style-type: none"> • Verify isolations for Reactor Level 2 and Drywell Pressure 1.39 psig. • Enter the Alternate Level Control procedure of EP-2. • Establish a pressure band of 800 -1060 psig. • Establish a level band of +30 to -30 in. • Inhibit ADS • Maximize CRD for flow.
	ACRO	When directed, maximize CRD for flow (only CRD B pump is available). <ul style="list-style-type: none"> • Re-energize 16B42 on P864 • Start the CRD B Aux Oil Pump • Start the CRD B Pump • Although there are other actions per the procedure, only these listed will accomplish anything. Update the CRS with reactor water level as it continues to lower.
	BOP	When directed, Inhibit ADS by placing both ADS inhibit switches to INHIBIT. Dispatch operators to recover out of service water injection sources. Evaluate and deliver ECCS Status Report to the CRS (hard card).
	ACRO	When E22-F004 HPCS injection valve is manually opened, control reactor water level in the established level band by starting and stopping the HPCS pump as required. *The crew injects HPCS to the reactor before reactor water level lowers to -191”.

Op-Test No: <u>12/11</u>		Scenario No: <u>4</u>	Event No: <u>6</u>
Event Description: <u>Division 3 Diesel Generator failure to start</u>			
TIME	Position	Applicant's Actions or Behavior	
	BOP	<p>Recognizes that electric bus 17AC is de-energized (HPCS diesel has failed to start and take the bus) and shuts the feeder breaker from ESF 12 transformer to re-energize the 17AC bus.</p> <p>*When Division 3 Diesel Generator fails to start, the crew re-energizes the 17AC bus with an alternate feeder (ESF 12). HPCS is the only recoverable system and power to this bus is required to run the HPCS pump.</p> <ul style="list-style-type: none"> ❖ This is indicated by many indications, but primarily the following annunciators <ul style="list-style-type: none"> ▪ P601-16A-H-3, HPCS SYS OOSVC ▪ P601-16A-H-1, HPCS SYS NOT READY FOR AUTO START ▪ P601-16A-D-3, HPCS DSL ENG TROUBLE ▪ P601-16A-F-2, HPCS SYS UNDERVOLT ❖ Many indicating lights will be de-energized on the P601-16 section of the P601. <p>Report the status of Division 3 Diesel Generator and 17AC to the CRS.</p>	

Op-Test No: <u>12/11</u>		Scenario No: <u>4</u>	Event No: <u>7</u>
Event Description: <u>Division 2 Diesel Generator running without cooling water</u>			
TIME	Position	Applicant's Actions or Behavior	
	BOP	<p>Recognizes that Division 2 Diesel Generator is running without cooling water and places the Division 2 Diesel Generator in Maintenance Mode.</p> <ul style="list-style-type: none"> ❖ As indicated by P41-F018B being de-energized and a lack of annunciator P870-7A-A-2, SSW DIV 2 OPER (this annunciator is expected when SSW auto initiates and all valves have repositioned to their required position). <p>Re-energizes electrical bus 16AB using ESF 12 feeder breaker.</p> <p>Report the status of Division 2 Diesel Generator and 16AB to the CRS.</p>	

Op-Test No: <u>12/11</u>		Scenario No: <u>4</u>	Event No: <u>8</u>
Event Description: <u>Loss of power to E22-F004 HPCS injection valve</u>			
TIME	Position	Applicant's Actions or Behavior	
	Crew	<p>Ensure an operator is sent to manually open E22-F004.</p> <p>*When E22-F004 loses power, the crew sends an operator to manually open the valve. HPCS is the only recoverable system and this valve must be manually opened in order to allow injection to the reactor. Criteria is that this valve is opened prior to reactor water level reaching -191”.</p> <p>Ensure an operator is sent to restore electrical power to E22-F004.</p>	

Give this sheet to the CRS

Turnover the following conditions:

Power	100%
Pressure	1030 psig
BOC	
EOOS	GREEN

- SSW B is in service.
- Suppression Pool temperature is elevated because of a weeping SRV.

Planned Evolutions this shift:

- The Crew will place Suppression Pool Cooling in service on RHR B. Pre-start pump checks are complete for RHR B pump.

Instructions:

- Check the applicant level and enter the operating test number and Form ES-D-1 event numbers for each event type; TS are not applicable for RO applicants. ROs must serve in both the "at-the-controls (ATC)" and "balance-of-plant (BOP)" positions; Instant SROs must serve in both the SRO and the ATC positions, including at least two instrument or component (I/C) malfunctions and one major transient, in the ATC position. If an Instant SRO *additionally* serves in the BOP position, one I/C malfunction can be credited toward the two I/C malfunctions required for the ATC position.
- Reactivity manipulations may be conducted under normal or *controlled* abnormal conditions (refer to Section D.5.d) but must be significant per Section C.2.a of Appendix D. (*) Reactivity and normal evolutions may be replaced with additional instrument or component malfunctions on a 1-for-1 basis.
- Whenever practical, both instrument and component malfunctions should be included; only those that require verifiable actions that provide insight to the applicant's competence count toward the minimum requirements specified for the applicant's license level in the right-hand columns.
