U.S. Nuclear Regulatory Commission
Document Control Desk
Washington, DC 20555

Subject: Duke Energy Carolinas, LLC
Oconee Nuclear Station Units 1 and 2
Docket No. 50-269, -270
Fourth Ten-Year Inservice Inspection Plan
Request for Relief No. 11-ON-001

Pursuant to 10 CFR 50.55a(g)(5)(iii), attached is a Request for Relief from the requirement to examine 100% of the volume specified by the American Society of Mechanical Engineers Boiler and Pressure Vessel Code (ASME Code), Section XI, Rules for Inservice Inspection of Nuclear Power Plant Components, 1998 Edition with 2000 Addenda (as modified by Code Case N-460).

The attached Request for Relief 11-ON-001 is to allow Duke Energy to take credit for the enclosed Table 1 list of limited ultrasonic examinations on welds associated with various systems and components during Unit 1 EOC25 and Unit 2 EOC24 refueling outages. The ultrasonic examination coverage of the subject Unit 1 and 2 welds did not meet the 90% examination requirements of Code Case N-460. The obtainable volume coverage for weld examination is indicated on Attachments A and B of the relief request. Achievement of greater examination coverage for these welds is impractical due to piping/valve geometry and interferences. Therefore, Duke Energy requests that the NRC grant relief as authorized under 10 CFR 50.55(g)(6)(i).

If there are any questions or further information is needed you may contact Corey Gray at (864)-873-6325.

Sincerely,

TPGillespie

T. Preston Gillespie Jr.,
Site Vice President

1.0 Scope of Relief Request

Relief is requested pursuant to 10 CFR 50.55a(g)(5)(iii) for welds listed in Table 1. These welds were required to be examined in accordance with Inservice Inspection Plans for the following Units.

Oconee Nuclear Station - Unit 1
Fourth 10-Year Inservice Inspection Interval
Interval Start Date: 01/01/2004

Oconee Nuclear Station - Unit 2
Fourth 10-Year Inservice Inspection Interval
Interval Start Date: 09/09/2004

Table 1

Relief Request Section Number	Oconee Unit Number	Examination Performed (Refueling Outage)	Weld ID Number	Item/Summary Number	Examination Data
2.0	1	1EOC25	1-PZR-WP26-4	O1.B3.110.0006	See Attachment A Pages 1-8

2.0 Weld #1-PZR-WP26-4

2.1. ASME Code Component(s) Affected

Unit 1 Pressurizer Upper Shell to Sampling Nozzle Weld, Weld #1-PZR-WP26-4, Summary Number O1.B3.110.0006

2.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

2.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

2.4. Impracticality of Compliance

- Surface 1: Shell - Carbon steel
- Surface 2: Sampling nozzle - Carbon steel
- Diameter: 5.750 in.
- Thickness: 6.187 in.

The ultrasonic examination of this weld obtained 34.7% coverage of the required examination volume. Because of the weld configuration, the requirements of ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6 could not be met. The aggregate coverage was calculated from the following base and weld metal scan results:

- Weld coverage using 35°, 45°& 60° shear waves for axial scans (S1, S2), and 35° & 45° shear waves for circ. scans (CW, CCW) obtained 15.4% coverage.
- Base material coverage using 35°, 45°& 60° shear wave for axial scans (S1) and 35°& 45° shear waves for circ. scans (CW, CCW) obtained 54.8% coverage.
- 0° scan coverage obtained 33.9% coverage.
- The aggregate coverage was calculated to be (15.4% + 54.8% + 33.9%)/3 = 34.7%.

The limitation was caused by the design of the sampling nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

2.5. Proposed Alternative and Basis for Use

No substitution alternative for this weld is available which would provide better coverage.

2.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

2.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.110.0006 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

3.0 Weld #1-PZR-WP26-5

3.1. ASME Code Component(s) Affected

Unit 1 Pressurizer Upper Shell to Sampling Nozzle Weld, Weld #1-PZR-WP26-5, Summary Number O1.B3.110.0007

3.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

3.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

3.4. Impracticality of Compliance

- Surface 1: Shell - Carbon steel
- Surface 2: Sampling nozzle - Carbon steel
- Diameter: 5.750 in.
- Thickness: 6.187 in.

The ultrasonic examination of this weld obtained 34.7% coverage of the required examination volume. Because of the weld configuration, the requirements of ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6 could not be met. The aggregate coverage was calculated from the following base and weld metal scan results:

- Weld coverage using 35°, 45°& 60° shear waves for axial scans (S1, S2), and 35° & 45° shear waves for circ. scans (CW, CCW) obtained 15.4% coverage.
- Base material coverage using 35°, 45°& 60° shear wave for axial scans (S1) and 35°& 45° shear waves for circ. scans (CW, CCW) obtained 54.8% coverage.
- 0° scan coverage obtained 33.9% coverage.
- The aggregate coverage was calculated to be (15.4% + 54.8% + 33.9%)/3 = 34.7%.

The limitation was caused by the design of the sampling nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

3.5. Proposed Alternative and Basis for Use

No substitution alternative for this weld is available which would provide better coverage.

3.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

3.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.110.0007 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

4.0 Weld #1-PZR-WP26-6

4.1. ASME Code Component(s) Affected

Unit 1 Pressurizer Upper Shell to Sampling Nozzle Weld, Weld #1-PZR-WP26-6, Summary Number O1.B3.110.0008

4.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

4.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

4.4. Impracticality of Compliance

- Surface 1: Shell - Carbon steel
- Surface 2: Sampling nozzle - Carbon steel
- Diameter: 5.750 in.
- Thickness: 6.187 in.

The ultrasonic examination of this weld obtained 34.7% coverage of the required examination volume. Because of the weld configuration, the requirements of ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6 could not be met. The aggregate coverage was calculated from the following base and weld metal scan results:

- Weld coverage using 35°, 45°& 60° shear waves for axial scans (S1, S2), and 35° & 45° shear waves for circ. scans (CW, CCW) obtained 15.4% coverage.
- Base material coverage using 35°, 45°& 60° shear wave for axial scans (S1) and 35°& 45° shear waves for circ. scans (CW, CCW) obtained 54.8% coverage.
- 0° scan coverage obtained 33.9% coverage.
- The aggregate coverage was calculated to be (15.4% + 54.8% + 33.9%)/3 = 34.7%.

The limitation was caused by the design of the sampling nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

4.5. Proposed Alternative and Basis for Use

No substitution alternative for this weld is available which would provide better coverage.

4.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

4.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.110.0008 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

5.0 Weld #1-PZR-WP26-1

5.1. ASME Code Component(s) Affected

Unit 1 Pressurizer Heater Belt Shell to Sampling Nozzle Weld, Weld #1-PZR-WP26-1, Summary Number O1.B3.110.0009

5.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

5.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

5.4. Impracticality of Compliance

- Surface 1: Shell - Carbon steel
- Surface 2: Sampling nozzle - Carbon steel
- Diameter: 5.750 in.
- Thickness: 6.187 in.

The ultrasonic examination of this weld obtained 34.7% coverage of the required examination volume. Because of the weld configuration, the requirements of ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6 could not be met. The aggregate coverage was calculated from the following base and weld metal scan results:

- Weld coverage using 35°, 45°& 60° shear waves for axial scans (S1, S2), and 35° & 45° shear waves for circ. scans (CW, CCW) obtained 15.4% coverage.
- Base material coverage using 35°, 45°& 60° shear wave for axial scans (S1) and 35°& 45° shear waves for circ. scans (CW, CCW) obtained 54.8% coverage.
- 0° scan coverage obtained 33.9% coverage.
- The aggregate coverage was calculated to be (15.4% + 54.8% + 33.9%)/3 = 34.7%.

The limitation was caused by the design of the sampling nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

5.5. Proposed Alternative and Basis for Use

No substitution alternative for this weld is available which would provide better coverage.

5.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

5.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.110.0009 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

6.0 Weld #1-PZR-WP26-2

6.1. ASME Code Component(s) Affected

Unit 1 Pressurizer Heater Belt Shell to Sampling Nozzle Weld, Weld #1-PZR-WP26-2, Summary Number O1.B3.110.0010

6.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

6.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

6.4. Impracticality of Compliance

- Surface 1: Shell - Carbon steel
- Surface 2: Sampling nozzle - Carbon steel
- Diameter: 5.750 in.
- Thickness: 6.187 in.

The ultrasonic examination of this weld obtained 34.7% coverage of the required examination volume. Because of the weld configuration, the requirements of ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6 could not be met. The aggregate coverage was calculated from the following base and weld metal scan results:

- Weld coverage using 35°, 45°& 60° shear waves for axial scans (S1, S2), and 35° & 45° shear waves for circ. scans (CW, CCW) obtained 15.4% coverage.
- Base material coverage using 35°, 45°& 60° shear wave for axial scans (S1) and 35°& 45° shear waves for circ. scans (CW, CCW) obtained 54.8% coverage.
- 0° scan coverage obtained 33.9% coverage.
- The aggregate coverage was calculated to be (15.4% + 54.8% + 33.9%)/3 = 34.7%.

The limitation was caused by the design of the sampling nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

6.5. Proposed Alternative and Basis for Use

No substitution alternative for this weld is available which would provide better coverage.

6.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

6.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.110.00010 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

7.0 Weld #1-51A-1-53755-V1

7.1. ASME Code Component(s) Affected

Unit 1 Letdown Cooler 1B Nozzle to Channel Body Weld, Weld #1-51A-1-53755-V1, Summary Number O1.B3.150.0003

7.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

7.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.150 Figure IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

7.4. Impracticality of Compliance

The Letdown Cooler Channel Body to Nozzle material is stainless steel. This weld has a diameter of NPS 3.0 inches and a wall thickness of 0.875 inches.

The ultrasonic examination of this weld obtained 54.6% coverage of the required examination volume. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

Letdown Cooler Nozzle to Channel Body		
Item No. 01.B3.150.0003 / Weld No. 1-51A-1-53755-V1		
Base Material Coverage		
Scan	Radius View	Non-Radius View
Axial	68.2%	52.7%
Circ	65.2%	54.4%
Aggregate @ 68.2 + 52.7 + 65.2 + 54.4 = 240.5/4 = 60.1%		
Weld Material Coverage		
Scan	Radius View	Non-Radius View
Axial-S1	45.9%	26.0%
Axial-S2	0.0%	0.0%
Circ-S2	94.1%	66.3%
Circ-S2	94.1%	66.3%
Aggregate @ 45.9 + 26.0 + 0.0 + 0.0 + 94.1 + 66.3 + 94.1 + 66.3 = 392.7/8 = 49.1%		
Total Aggregate @ 60.1 + 49.1 = 109.2/2 = 54.6%		

The individual scan results are recorded on the table above. The limitation was caused by the weld taper configuration created by the attachment of the nozzle to the channel body. In order to scan all of the required volume for this weld, the nozzle to channel body would have to be redesigned to allow scanning from both sides of the weld, which is impractical. There were no recordable indications found during the examination of this weld. This weld was examined using

procedures and personnel qualified in accordance with ASME Section XI, Appendix III.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

7.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because there is no access for film placement.

No other substitution alternative for this weld is available which would provide better coverage.

7.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

7.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.150.0003 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

8.0 Weld #1-51A-1-53755-V2

8.1. ASME Code Component(s) Affected

Unit 1 Letdown Cooler 1B Nozzle to Channel Body Weld, Weld #1-51A-1-53755-V2, Summary Number O1.B3.150.0004

8.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

8.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.150 Figure IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

8.4. Impracticality of Compliance

The Letdown Cooler Channel Body to Nozzle material is stainless steel. This weld has a diameter of NPS 3.0 inches and a wall thickness of 0.875 inches.

The ultrasonic examination of this weld obtained 54.6% coverage of the required examination volume. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

Letdown Cooler Nozzle to Channel Body		
Item No. 01.B3.150.0004 / Weld No. 1-51A-1-53755-V2		
Base Material Coverage		
Scan	Radius View	Non-Radius View
Axial	68.2%	52.7%
Circ	65.2%	54.4%
Aggregate @ 68.2 + 52.7 + 65.2 + 54.4 = 240.5/4 = 60.1%		
Weld Material Coverage		
Scan	Radius View	Non-Radius View
Axial-S1	45.9%	26.0%
Axial-S2	0.0%	0.0%
Circ-S2	94.1%	66.3%
Circ-S2	94.1%	66.3%
Aggregate @ 45.9 + 26.0 + 0.0 + 0.0 + 94.1 + 66.3 + 94.1 + 66.3 = 392.7/8 = 49.1%		
Total Aggregate @ 60.1 + 49.1 = 109.2/2 = 54.6%		

The individual scan results are recorded on the table above. The limitation was caused by the weld taper configuration created by the attachment of the nozzle to the channel body configuration. In order to scan all of the required volume for this weld, the nozzle to channel body would have to be redesigned to allow scanning from both sides of the weld, which is impractical. There were no recordable indications found during the examination of this weld. This weld was

examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix III.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. The achieved coverage did not meet the acceptance criteria of this Code Case.

8.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because there is no access for film placement.

No other substitution alternative for this weld is available which would provide better coverage.

8.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

8.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B3.150.0004 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

9.0 Weld #1LP-209-8L

9.1. ASME Code Component(s) Affected

Unit 1 Valve 1CF-13 to Elbow Piping Weld, Weld #1LP-209-8L, Summary Number O1.B9.11.0003

9.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

9.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-J, Item Number B9.11 Figure IWB-2500-8 (c), 100% Volume Coverage of Examination Volume C-D-E-F

9.4. Impracticality of Compliance

The valve material is cast stainless steel and the elbow material is stainless steel. This weld has a diameter of NPS 14.0 inches and a wall thickness of 1.25 inches.

The ultrasonic examination of this weld obtained 37.500% coverage of the required examination volume. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 45° obtained 50% coverage in one axial direction (S1 - elbow)
- 45° obtained 0% coverage in one axial direction (S2 - valve)
- 45° shear waves obtained 50% coverage in one circ. directions (S3 - CW)
- 45° shear waves obtained 50% coverage in one circ. directions (S4 - CCW)
- The aggregate coverage was calculated to be (50% + 0% + 50% + 50%)/4 = 37.500%.

The individual scan results are recorded on the form labeled "Determination of Percent Coverage for UT Examinations – Pipe. The limitation was caused by the cast stainless material and the weld taper configuration created by the attachment of the valve to elbow configuration. In order to scan all of the required volume for this weld, the valve would have to be replaced with forged stainless steel and would have to be redesigned to allow scanning from both sides of the weld, which is impractical. There were no recordable indications found during the examination of this weld. This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. The achieved coverage did not meet the acceptance criteria of this Code Case.

9.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

9.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

9.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B9.11.0003 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this B9.11 item. The result from the surface examination was acceptable.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

10.0 Weld #1PIA2-9

10.1. ASME Code Component(s) Affected

Unit 1 Reactor Coolant Pump 1A2 Casing Nozzle to Safe-End Piping Weld, Weld #1PIA2-9, Summary Number O1.B9.11.0050

10.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

10.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-J, Item Number B9.11 Figure IWB-2500-8 (c), 100% Volume Coverage of Examination Volume C-D-E-F

10.4. Impracticality of Compliance

The Pump Casing Nozzle material is cast stainless steel and the pipe material is stainless steel. This weld has a diameter of 36.50 inches and a wall thickness of 2.330 inches.

The ultrasonic examination of this weld obtained 36.275% coverage of the required examination volume. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 60° shear waves obtained 0% coverage in one axial direction (S1 - nozzle)
- 60° shear waves obtained 45.10% coverage in one axial direction (S2 - pipe)
- 45° shear waves obtained 50% coverage in one circ. directions (S3 - CW)
- 45° shear waves obtained 50% coverage in one circ. directions (S4 - CCW)
- The aggregate coverage was calculated to be (0% + 45.10% + 50% + 50%)/4 = 36.275%.
- In addition, a best effort examination was performed in axial direction (S1) using 60° and 70° longitudinal waves to the extent possible in the upper 2/3 area of interest.

The individual scan results are recorded on the form labeled "Determination of Percent Coverage for UT Examinations – Pipe. The limitation was caused by the cast stainless material and the weld taper configuration created by the attachment of the nozzle to safe end configuration. In order to scan all of the required volume for this weld, the pump would have to be replaced with forged stainless steel and would have to be redesigned to allow scanning from both sides of the weld, which is impractical. There were no recordable indications found during the examination of this weld. This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. The achieved coverage did not meet the acceptance criteria of this Code Case.

10.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

10.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

10.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B9.11.0050 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

Duke performed a surface examination (code required) on this B9.11 item. The result from the surface examination was acceptable.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

11.0 Weld #1PDA2-1

11.1. ASME Code Component(s) Affected

Unit 1 Reactor Coolant Pump 1A2 Casing Nozzle to Safe-End Weld, Weld #1PDA2-1, Summary Number O1.B9.11.0062

11.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

11.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-J, Item Number B9.11 Figure IWB-2500-8 (c), 100% Volume Coverage of Examination Volume C-D-E-F

11.4. Impracticality of Compliance

The Pump Casing Nozzle material is cast stainless steel and the pipe material is stainless steel. This weld has a diameter of 33.50 inches and a wall thickness of 2.33 inches.

The ultrasonic examination of this weld obtained 37.500% coverage of the required examination volume. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 45 shear waves obtained 50% coverage in one axial direction (S1 - pipe)
- 45 shear waves obtained 0% coverage in one axial direction (S2 - nozzle)
- 45° shear waves obtained 50% coverage in one circ. directions (S3 - CW)
- 45° shear waves obtained 50% coverage in one circ. directions (S4 - CCW)
- The aggregate coverage was calculated to be (50% + 0% + 50% + 50%)/4 = 37.500%.
- In addition, a best effort examination was performed in axial direction (S1) using 60° and 70° longitudinal waves to the extent possible in the upper 2/3 area of interest.

The individual scan results are recorded on the form labeled "Determination of Percent Coverage for UT Examinations – Pipe. The limitation was caused by the cast stainless material and the weld taper configuration created by the attachment of the nozzle to safe end configuration. In order to scan all of the required volume for this weld, the pump would have to be replaced with forged stainless steel and would have to be redesigned to allow scanning from both sides of the weld, which is impractical. There were no recordable indications found during the examination of this weld. This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. The achieved coverage did not meet the acceptance criteria of this Code Case.

11.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

11.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

11.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.B9.11.0062 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this B9.11 item. The result from the surface examination was acceptable.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

12.0 Weld #1-53A-02-65L

12.1. ASME Code Component(s) Affected

Unit 1 Pipe to Valve 1LP-47 Weld, Weld #1-53A-02-65L, Summary Number O1.C5.11.0028

12.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

12.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.11 Figure IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

12.4. Impracticality of Compliance

The valve material is cast stainless steel and the pipe material is stainless steel. This weld has a diameter of NPS 10.0 inches and a wall thickness of 1.125 inches.

During the ultrasonic examination of this weld, 37.50% coverage of the required examination volume was obtained. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv)(A)(1). The aggregate coverage was calculated as follows:

- 45° shear waves obtained 0% coverage in one axial direction (S1 – valve)
- 45° shear waves obtained 50% coverage in one axial direction (S2 – pipe)
- 45° shear waves obtained 50% coverage in one circ. direction (S3 – CW)
- 45° shear waves obtained 50% coverage in one circ. direction (S4 – CCW)
- The aggregate coverage was calculated to be (0% + 50% +50% + 50%)/4 = 37.5%

In order to scan all of the required volume for this weld, the valve would have to be replaced with forged stainless steel, which is impractical. There were no recordable indications found during the examination of this weld.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

12.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

12.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

12.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.C5.11.0028 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.11 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

13.4. Impracticality of Compliance

The valve material is forged stainless steel and the pipe material is stainless steel seamless pipe. This weld has a diameter of NPS 4.0 inches and a wall thickness of .674 inches.

- 45° shear waves obtained 50% coverage in one axial direction (S1 - pipe)
- 45° shear waves obtained 0% coverage in one axial direction (S2 - valve)
- 38° shear waves obtained 50% coverage in one circ direction (S3 - CW)
- 38° shear waves obtained 50% coverage in one circ direction (S4 - CCW)
- The aggregate coverage was calculated to be (50% + 0% + 50% + 50%)/4 = 37.5%

In order to scan all of the required volume for this weld, the valve would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

13.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

13.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

13.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.C5.21.0004 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.21 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

14.0 Weld #1HP-387-118A

14.1. ASME Code Component(s) Affected

Unit 1 Elbow to Valve 1HP-118 Weld, Weld #1HP-387-118A, Summary Number O1.C5.21.0027

14.2. Applicable Code Edition and Addenda

14.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Fig. IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

14.4. Impracticality of Compliance

The valve material is forged stainless steel and the elbow material is stainless steel seamless pipe. This weld has a diameter of NPS 4.0 inches and a wall thickness of .531 inches.

During the ultrasonic examination of this weld, 75% coverage of the required examination volume was obtained. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv)(A)(1). The aggregate coverage was calculated as follows:

- 60° shear waves obtained 100% coverage in one axial direction (S1 – pipe)
- 60° shear waves obtained 100% coverage in one axial direction (S2 – valve)
- 45° shear waves obtained 50% coverage in one circ. direction (S3 – CW)
- 45° shear waves obtained 50% coverage in one circ. direction (S4 – CCW)
- The aggregate coverage was calculated to be (100% +100% +50% + 50%)/4 = 75%

In order to scan all of the required volume for this weld, the valve would have to be redesigned. There were no recordable indications found during the examination of this weld.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

14.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

14.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

14.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.C5.21.0027 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.21 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

15.0 Weld #1HP-193-17

15.1. ASME Code Component(s) Affected

Unit 1 Pipe to Tee Weld, Weld #1HP-193-17, Summary Number O1.C5.21.0040

15.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

15.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Fig. IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

15.4. Impracticality of Compliance

The pipe and tee material is stainless steel. This weld has a diameter of NPS 2.5 inches and a wall thickness of .375 inches.

During the ultrasonic examination of this weld, 37.50% coverage of the required examination volume was obtained. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv)(A)(1). The aggregate coverage was calculated as follows:

- 60° shear waves obtained 50% coverage in one axial direction (S1 – pipe)
- 60° shear waves obtained 0% coverage in one axial direction (S2 – tee)
- 45° shear waves obtained 50% coverage in one circ. direction (S3 – CW)
- 45° shear waves obtained 50% coverage in one circ. direction (S4 – CCW)
- The aggregate coverage was calculated to be (50% +0% +50% + 50%)/4 = 37.5%

In order to scan all of the required volume for this weld, the tee would have to be redesigned, which is impractical. There were no recordable indications found during the examination of this weld.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

15.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

15.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

15.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.C5.21.0040 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.21 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

16.0 Weld #1-51A-02-16BH

16.1. ASME Code Component(s) Affected

Unit 1 Pipe to Flange Weld, Weld #1-51A-02-16BH, Summary Number O1.C5.21.0051

16.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

16.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Fig. IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

16.4. Impracticality of Compliance

The pipe to flange material is stainless steel. This weld has a diameter of NPS 4.0 inches and a wall thickness of .531 inches.

- 60° shear waves obtained 0% coverage in one axial direction (S1 - flange)
- 60° shear waves obtained 50% coverage in one axial direction (S2 - pipe)
- 45° shear waves obtained 50% coverage in one axial direction (S3 - CW)
- 45° shear waves obtained 50% coverage in one axial direction (S4 - CCW)
- The limitation was caused by the taper on the flange side of the weld.
- The aggregate coverage was calculated to be (0% + 50% + 50% + 50%)/4 = 37.5%

In order to scan all of the required volume for this weld, the flange would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

16.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

16.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

16.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O1.C5.21.0051 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.21 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

17.0 Weld #1HP-0187-184

17.1. ASME Code Component(s) Affected

Unit 1 Pipe to Valve 1HP140 Weld, Weld #1HP-0187-184, Summary Number PSI

17.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

17.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Fig. IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

17.4. Impracticality of Compliance

The valve material is cast stainless steel and the pipe material is stainless steel seamless pipe. This weld has a diameter of NPS 4.0 inches and a wall thickness of .531 inches.

During the ultrasonic examination of this weld, 37.5% coverage of the required examination volume was obtained. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv)(A)(1). The aggregate coverage was calculated as follows:

- 60° shear waves obtained 50% coverage in one axial direction (S1 – pipe)
- 60° shear waves obtained 0% coverage in one axial direction (S2 – valve)
- 45° shear waves obtained 50% coverage in one circ. direction (S3 – CW)
- 45° shear waves obtained 50% coverage in one circ. direction (S4 – CCW)
- The aggregate coverage was calculated to be (50% +0% +50% + 50%)/4 = 37.5%

In order to scan all of the required volume for this weld, the valve would have to be redesigned. There were no recordable indications found during the examination of this weld.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

17.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

17.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

17.7. Justification for Granting Relief

Ultrasonic examination of the weld for the Pre Service Inspection was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.21 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

18.0 Weld #1HP-0187-185

18.1. ASME Code Component(s) Affected

Unit 1 Pipe to Valve 1HP139 Weld, Weld #1HP-0187-185, Summary Number PSI

18.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

18.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Fig. IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

18.4. Impracticality of Compliance

The valve material is forged stainless steel and the pipe material is stainless steel seamless pipe. This weld has a diameter of NPS 4.0 inches and a wall thickness of .531 inches.

During the ultrasonic examination of this weld, 37.5% coverage of the required examination volume was obtained. Scanning requirements are described in 10CFR.50.55a(b)(2)(xv)(A)(1). The aggregate coverage was calculated as follows:

- 60° shear waves obtained 0% coverage in one axial direction (S1 – valve)
- 60° shear waves obtained 50% coverage in one axial direction (S2 – pipe)
- 45° shear waves obtained 50% coverage in one circ. direction (S3 – CW)
- 45° shear waves obtained 50% coverage in one circ. direction (S4 – CCW)
- The aggregate coverage was calculated to be (0% +50% +50% + 50%)/4 = 37.5%

In order to scan all of the required volume for this weld, the valve would have to be redesigned. There were no recordable indications found during the examination of this weld.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

18.5. Proposed Alternative and Basis for Use

No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect expected degradation mechanisms such as thermal fatigue cracking and stress corrosion crack initiating at the pipe inside surface. Additionally, radiography has not been qualified through performance demonstration.

No substitution alternative for this weld is available which would provide better coverage.

18.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014.

18.7. Justification for Granting Relief

Ultrasonic examination of the weld for the Pre Service Inspection was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this C5.21 item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

19.0 Weld #2-PZR-WP34

19.1. ASME Code Component(s) Affected

Unit 2 Pressurizer Upper Head to Spray Nozzle Weld, Weld #2-PZR-WP34, Summary Number O2.B3.110.0002

19.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

19.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

19.4. Impracticality of Compliance

Component:

- Surface 1: Upper Head - Carbon steel
- Surface 2: Spray nozzle - Carbon steel
- Diameter: 7.750 in.
- Thickness: 4.750 in.

Scan requirements are described in ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6. The aggregate coverage was calculated from the following base and weld metal scan results:

- Base material coverage provided an aggregate coverage of 77.1%
- Weld metal coverage provided an aggregate coverage of 75.0%
- The total obtained aggregate coverage was (77.1 + 75.0 = 152.1)/2 = 76.1%

The limitation was caused by the design of the spray nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the spray nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

19.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because there is no access for film placement.

No other substitution alternative for this weld is available which would provide better coverage.

19.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

19.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.B3.110.0002 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

20.0 Weld #2-PZR-WP33-3

20.1. ASME Code Component(s) Affected

Unit 2 Pressurizer Upper Head to Relief Nozzle Weld, Weld #2-PZR-WP33-3, Summary Number O2.B3.110.0003

20.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

20.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

20.4. Impracticality of Compliance

Component:

- Surface 1: Upper Head - Carbon steel
- Surface 2: Relief nozzle - Carbon steel
- Diameter: 6.875 in.
- Thickness: 4.750 in.

Scan requirements are described in ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6. The aggregate coverage was calculated from the following base and weld metal scan results:

- Base material coverage provided an aggregate coverage of 69.3%
- Weld metal coverage provided an aggregate coverage of 73.1%
- The total obtained aggregate coverage was (69.3 + 73.1 = 142.4)/2 = 71.2%

The limitation was caused by the design of the relief nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the relief nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

20.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because there is no access for film placement.

No other substitution alternative for this weld is available which would provide better coverage.

20.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

20.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.B3.110.0003 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

21.0 Weld #2-PZR-WP33-1

21.1. ASME Code Component(s) Affected

Unit 2 Pressurizer Upper Head to Relief Nozzle Weld, Weld #2-PZR-WP33-1, Summary Number O2.B3.110.0005

21.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

21.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-D, Item Number B3.110 Fig. IWB-2500-7 (a), 100% Volume Coverage of Examination Volume A-B-C-D-E-F-G-H-I

21.4. Impracticality of Compliance

Component:

- Surface 1: Upper Head - Carbon steel
- Surface 2: Relief nozzle - Carbon steel
- Diameter: 6.875 in.
- Thickness: 4.750 in.

Scan requirements are described in ASME Section V, Article 4, T-441.1.2(a), T-441.1.3, T-441.1.4, T-441.1.5 and T-441.1.6. The aggregate coverage was calculated from the following base and weld metal scan results:

- Base material coverage provided an aggregate coverage of 69.3%
- Weld metal coverage provided an aggregate coverage of 73.1%
- The total obtained aggregate coverage was (69.3 + 73.1 = 142.2)/2 = 71.2%

The limitation was caused by the design of the relief nozzle not allowing for scanning from the nozzle side of the weld. In order to scan all of the required volume for this weld, the relief nozzle would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume A-B-C-D-E-F-G-H-I. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

21.5. Proposed Alternative and Basis for Use

Radiography (RT) is not a desired option because there is no access for film placement.

No other substitution alternative for this weld is available which would provide better coverage.

21.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

21.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.B3.110.0005 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

22.0 Weld #2-PIA1-8

22.1. ASME Code Component(s) Affected

Unit 2 Reactor Coolant Pump 2A1 Casing Nozzle to Safe-End Piping Weld, Weld #2-PIA1-8, Summary Number O2.B9.11.0046

22.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

22.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-J, Item Number B9.11 Figure IWB-2500-8 (c), 100% Volume Coverage of Examination Volume C-D-E-F

22.4. Impracticality of Compliance

Component configuration:

- Surface 1: Cast stainless steel pump casing
- Surface 2: Stainless steel safe end
- NPS: 33.50 in.
- Thickness: 2.330 in.

Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 60° shear waves obtained 0.0% coverage in one axial direction (S1 - pump casing)
- 60° shear waves obtained 50% coverage in one axial direction (S2 - safe end)
- 45° shear waves obtained 50% coverage in one circ. direction (CW).
- 45° shear waves obtained 50% coverage in one circ. direction (CCW).
- The aggregate coverage was calculated to be (0.0% + 50.0% + 50% + 50%)/4 = 37.5%.
- In addition, a best effort examination was performed using 60° and 70° longitudinal waves to the extent possible from the cast stainless side in the upper 2/3 area of interest.

The limitation was caused by the cast stainless steel pump casing material. In order to scan all of the required volume for this weld, the pump casing would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

22.5. Proposed Alternative and Basis for Use

This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII. No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect service induced flaws. Additionally, radiography has not been qualified through performance demonstration.

22.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

22.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.B9.11.0046 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

23.0 Weld #2-PDA2-1

23.1. ASME Code Component(s) Affected

Unit 2 Reactor Coolant Pump 2A2 Casing Nozzle to Safe-End Piping Weld, Weld #2-PDA2-1, Summary Number O2.B9.11.0053

23.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

23.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-J, Item Number B9.11 Figure IWB-2500-8 (c), 100% Volume Coverage of Examination Volume C-D-E-F

23.4. Impracticality of Compliance

Component configuration:

- Surface 1: Stainless steel safe end
- Surface 2: Cast stainless steel pump casing
- NPS: 33.50 in.
- Thickness: 2.330 in.

Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 60° shear waves obtained 54.8% coverage in one axial direction (S1 - safe end)
- 60° shear waves obtained 0.0% coverage in one axial direction (S2 - pump casing)
- 45° shear waves obtained 50% coverage in one circ. direction (CW).
- 45° shear waves obtained 50% coverage in one circ. direction (CCW).
- The aggregate coverage was calculated to be (54.8% + 0.0% + 50% + 50%)/4 = 38.7%.
- In addition, a best effort examination was performed using 60° and 70° longitudinal waves to the extent possible from the cast stainless side in the upper 2/3 area of interest.

The limitation was caused by the pump casing material. In order to scan all of the required volume for this weld, the pump casing would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

23.5. Proposed Alternative and Basis for Use

This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII. No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect service induced flaws. Additionally, radiography has not been qualified through performance demonstration.

23.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

23.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.B9.11.0053 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

24.0 Weld #2-PDB2-1

24.1. ASME Code Component(s) Affected

Unit 2 Reactor Coolant Pump 2B2 Casing Nozzle to Safe-End Piping Weld, Weld #2-PDB2-1, Summary Number O2.B9.11.0063

24.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

24.3. Applicable Code Requirement

IWB-2500, Table IWB-2500-1, Examination Category B-J, Item Number B9.11 Figure IWB-2500-8 (c), 100% Volume Coverage of Examination Volume C-D-E-F

24.4. Impracticality of Compliance

Component configuration:

- Surface 1: Stainless steel safe end
- Surface 2: Cast stainless steel pump casing
- NPS: 33.50 in.
- Thickness: 2.330 in.

Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 60° shear waves obtained 58% coverage in one axial direction (S1 - safe end)
- 60° shear waves obtained 0.0% coverage in one axial direction (S2 - pump casing)
- 45° shear waves obtained 50% coverage in one circ. direction (CW).
- 45° shear waves obtained 50% coverage in one circ. direction (CCW).
- The aggregate coverage was calculated to be (58.0% + 0.0% + 50% + 50%)/4 = 39.5%.
- In addition, a best effort examination was performed using 60° and 70° longitudinal waves to the extent possible from the cast stainless side in the upper 2/3 area of interest.

The limitation was caused by the pump casing material. In order to scan all of the required volume for this weld, the pump casing would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

24.5. Proposed Alternative and Basis for Use

This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII. No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect service induced flaws. Additionally, radiography has not been qualified through performance demonstration.

24.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

24.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.B9.11.0063 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each refueling outage in accordance with Table IWB-2500-1; Examination Category B-P requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

25.0 Weld #2LP-215-27

25.1. ASME Code Component(s) Affected

Unit 2 Pipe to Valve 2LP-177 Weld, Weld #2LP-215-27, Summary Number O2.C5.11.0038

25.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

25.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.11 Figure IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

25.4. Impracticality of Compliance

Component configuration:

- Surface 1: Forged stainless steel valve
- Surface 2: Stainless steel pipe
- NPS: 10.0 in.
- Thickness: 1.0 in.

Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 60° shear waves obtained 100% coverage in one axial direction (S1 - valve)
- 45° shear waves obtained 99.4% coverage in one axial direction (S2 - pipe)
- 45° shear waves obtained 50% coverage in one circ. direction (CW).
- 45° shear waves obtained 50% coverage in one circ. direction (CCW).
- The aggregate coverage was calculated to be (100.0% + 99.4% + 50% + 50%)/4 = 74.9%.

The limitation was caused by the taper of the valve body, and a weld-o-let. In order to scan all of the required volume for this weld, the valve would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

25.5. Proposed Alternative and Basis for Use

This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII. No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect service induced flaws. Additionally, radiography has not been qualified through performance demonstration.

25.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

25.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.C5.11.0038 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1; Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric and pressure test), Reactor Building Normal Sump monitoring provides additional assurance that, in the event that leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

26.0 Weld #2HP-341-V1

26.1. ASME Code Component(s) Affected

Unit 2 Pipe to Valve 2HP-120 Weld, Weld #2HP-341-V1, Summary Number O2.C5.21.0035

26.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

26.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Figure IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

26.4. Impracticality of Compliance

Component configuration:

- Surface 1: Forged stainless steel valve
- Surface 2: Stainless steel pipe
- NPS: 2.5 in.
- Thickness: 0.375 in.

Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following:

- 60° shear waves obtained 0.0% coverage in one axial direction (S1 - valve)
- 60° shear waves obtained 50% coverage in one axial direction (S2 - pipe)
- 45° shear waves obtained 100% coverage in one circ. direction (CW).
- 45° shear waves obtained 100% coverage in one circ. direction (CCW).
- The aggregate coverage was calculated to be (0.0% + 50% + 100% + 100%)/4 = 62.5%.

The limitation was caused by the taper of the valve body. In order to scan all of the required volume for this weld, the valve would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

26.5. Proposed Alternative and Basis for Use

This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII. No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect service induced flaws. Additionally, radiography has not been qualified through performance demonstration.

26.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

26.7. Justification for Granting Relief

Ultrasonic examination of the weld for the item number O2.C5.21.0035 was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

27.0 Weld #2-51A-0029-94

27.1. ASME Code Component(s) Affected

Unit 2 Pipe to Valve 2HP-139 Weld, Weld #2-51A-0029-94, PSI

27.2. Applicable Code Edition and Addenda

ASME Boiler and Pressure Vessel Code, Section XI, 1998 Edition through the 2000 Addenda

27.3. Applicable Code Requirement

IWC-2500, Table IWC-2500-1, Examination Category C-F-1, Item Number C5.21 Fig. IWC-2500-7(a), 100% Volume Coverage of Examination Volume C-D-E-F

27.4. Impracticality of Compliance

Component configuration:

- Surface 1: Forged stainless steel valve
- Surface 2: Stainless steel pipe
- NPS: 4.0 in.
- Thickness: 0.531 in.

Scanning requirements are described in 10CFR.50.55a(b)(2)(xv) (A)(1). The aggregate coverage was calculated from the following data:

- 60° shear waves obtained 0.0% coverage in one axial direction (S1 - valve)
- 60° shear waves obtained 50% coverage in one axial direction (S2 - pipe)
- 45° shear waves obtained 50% coverage in one circ. direction (CW).
- 45° shear waves obtained 50% coverage in one circ. direction (CCW).
- The aggregate coverage was calculated to be (0.0% + 50% + 50% + 50%)/4 = 37.5%.

The limitation was caused by the taper of the valve body. In order to scan all of the required volume for this weld, the valve would have to be redesigned, which is impractical.

The Oconee Inservice Inspection Plan allows the use of Code Case N-460, which requires greater than 90% volumetric coverage of examination volume C-D-E-F. Therefore, the available coverage will not meet the acceptance criteria of this Code Case.

27.5. Proposed Alternative and Basis for Use

This weld was examined using procedures, equipment, and personnel qualified in accordance with ASME Section XI, Appendix VIII. No alternative examinations are planned for the weld during the current inspection interval. Radiography (RT) is not a desired option because RT is limited in the ability to detect service induced flaws. Additionally, radiography has not been qualified through performance demonstration.

27.6. Duration of Proposed Alternative

This request is for the duration of the fourth inservice inspection interval, currently scheduled to end on July 15, 2014

27.7. Justification for Granting Relief

Ultrasonic examination of the weld for the PSI was conducted using personnel, equipment, and procedures qualified in accordance with ASME Section XI, 1998 Edition with the 2000 Addenda.

In addition to the volumetric examination with limited coverage, Duke performed a surface examination (code required) on this PSI item. The result from the surface examination was acceptable.

The system leakage test performed each inspection period in accordance with Table IWC-2500-1, Examination Category C-H requires a VT-2 visual examination to detect evidence of leakage. This test and VT-2 examination provides additional assurance of pressure boundary integrity.

In addition to the above Code required examinations (volumetric, surface, and pressure test), visual observations performed during operator rounds provide additional assurance that in the event leakage did occur through this weld, it would be detected and proper action taken.

Duke has examined the weld/component to the maximum extent possible utilizing approved examination techniques and equipment. Based on the acceptable results for the coverage completed by the volumetric examination, the acceptable results of the surface examinations performed during this outage, the pressure testing (VT-2) examinations required by Section XI, and the leakage monitoring, it is Duke's position that the combination of examinations provides a reasonable assurance of quality and safety.

Inspector/Date : Steven Dean 10/28/09

☐ Total Weld Metal Examined with at least 2 angles from one direction.

A combination of 35°,45°, and 60° angles were used to obtain coverage.

% Examined from Surface 1 = 7.015 / 11.413 x 100 = 61.46%.

% Examined from Surface 2, CW, and CCW = 0%.

Determination of Percent Coverage for UT Examinations - Pipe

Site/Unit:	Oconee / 1	Procedure:	PDI-UT-2	Outage No.:	O1-25
Summary No.:	O1.B9.11.0062	Procedure Rev.:	C	Report No.:	UT-09-349
Workscope:	ISI	Work Order No.:	01841924	Page:	5 of 5

45 deg

Scan 1	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 1
Scan 2	100.000	% Length X	0.000	% volume of length / 100 =	0.000	% total for Scan 2
Scan 3	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 3
Scan 4	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 4

Add totals and divide by # scans = 37.500 % total for 45 deg

Other deg - _____ (to be used for supplemental scans)

The data to be listed below is for coverage that was not obtained with the 45 deg scans.

Scan 1		% Length X		% volume of length / 100 =		% total for Scan 1
Scan 2		% Length X		% volume of length / 100 =		% total for Scan 2
Scan 3		% Length X		% volume of length / 100 =		% total for Scan 3
Scan 4		% Length X		% volume of length / 100 =		% total for Scan 4

Percent complete coverage

Add totals for each scan required and divide by # of scans to determine;

37.500 % Total for complete exam

Determination of Percent Coverage for UT Examinations - Pipe

Site/Unit:	Oconee / 1	Procedure:	PDI-UT-2	Outage No.:	O1-25
Summary No.:	O1.C5.21.0004	Procedure Rev.:	C	Report No.:	UT-09-296
Workscope:	ISI	Work Order No.:	01846023	Page:	7 of 7

45 deg / 38 deg

Scan 1	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 1
Scan 2	100.000	% Length X	0.000	% volume of length / 100 =	0.000	% total for Scan 2
Scan 3	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 3
Scan 4	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 4

Add totals and divide by # scans = 37.500 **% total for 45 deg**

Other deg - _____ (to be used for supplemental scans)

The data to be listed below is for coverage that was not obtained with the 45 deg scans.

Scan 1	_____	% Length X	_____	% volume of length / 100 =	_____	% total for Scan 1
Scan 2	_____	% Length X	_____	% volume of length / 100 =	_____	% total for Scan 2
Scan 3	_____	% Length X	_____	% volume of length / 100 =	_____	% total for Scan 3
Scan 4	_____	% Length X	_____	% volume of length / 100 =	_____	% total for Scan 4

Percent complete coverage

Add totals for each scan required and divide by # of scans to determine;

37.500 **% Total for complete exam**

Determination of Percent Coverage for UT Examinations - Pipe

Site/Unit:	Oconee / 1	Procedure:	NDE-600	Outage No.:	N/A
Summary No.:	1-HP-0187-185	Procedure Rev.:	17	Report No.:	BOP-UT-09-089
Workscope:	PSI	Work Order No.:	01859555	Page:	2 of 5

45 deg

Scan 1		% Length X		% volume of length / 100 =		% total for Scan 1
Scan 2		% Length X		% volume of length / 100 =		% total for Scan 2
Scan 3	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 3
Scan 4	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 4

Add totals and divide by # scans = 50.000 **% total for 45 deg**

Other deg - 60 (to be used for supplemental scans)

The data to be listed below is for coverage that was not obtained with the 45 deg scans.

Scan 1	100.000	% Length X	0.000	% volume of length / 100 =	0.000	% total for Scan 1
Scan 2	100.000	% Length X	50.000	% volume of length / 100 =	50.000	% total for Scan 2
Scan 3		% Length X		% volume of length / 100 =		% total for Scan 3
Scan 4		% Length X		% volume of length / 100 =		% total for Scan 4

Percent complete coverage

Add totals for each scan required and divide by # of scans to determine;

37.500 **% Total for complete exam**

Site Field Supervisor: Rodney Sheffield Date: 10/29/2009
