Subject: Attachments: Flooding Evaluation Man Hour Estimate

SECY Item 2 1 and 2 3 Manhour Estimates Revision 2.xls

## Ed;

The Flooding Task Force man hour estimates for walkdowns, evaluations, and integrated assessment are attached for your information. The following provides a context for the estimates.

- The Flooding Task Force developed these estimates based on experience and vendor input.
  The task force is comprised of senior engineers and engineering managers from around 15
  utilities. They have extensive experience in engineering analysis and walkdowns. A few of
  the task force members have also done or managed flood evaluations. The estimates have
  gone through several rounds of comment and revision by task force members.
- The vendor manhour estimates for evaluations were based on input from vendors who have
  done these evaluations for COLs and some existing plants. The task force was briefed by 4
  vendors during one of our meetings in January and subsequently received manhour estimates
  from 3 of them. The high and low values from this vendor input were used to create the
  spreadsheet.
- The estimates for the vendor flood evaluations for the different types of sites were developed by assuming that the sites needed the following types of evaluations:
  - Complex sites (two flood hazards): research + PMP + river flood + surge/seiche + tsunami + ice effect + wave runup
  - River sites with dams: research + PMP + river flood + dam failure + ice effect + wave runup
  - o River sites with no dams: research + PMP + river flood ice effect
  - Coastal sites: research + PMP + surge/seiche + tsunami + wave runup
  - Lake sites: research + PMP + surge/seiche + wave runup
  - Land bound sites: research + PMP
  - Sites with COL docketed: research (and gap analysis) + PMP
- The flood evaluations will need significant utility support and processing as detailed in the spreadsheet
- Since we have not written the integrated analysis guidance yet, we made this estimate based on what we believe the guidance will address and related work will entail.

We believe that the estimates are representative of the level of effort that will be required. Note in particular the estimate for vendor work on flood evaluations (approximately 1.5 to 4.5 man years for the average evaluation); this will be a particular challenge due to the limited resources for this kind of work.

# Thanks for taking our input.

Jim Riley
