Watts Bar Nuclear Plant, Unit 2
Construction Permit No. CPPR-92
NRC Docket No. 50-391

Subject: **Watts Bar Nuclear Plant (WBN) Unit 2 - Submittal of Preoperational Test Instruction**

The following approved WBN Unit 2 Preoperational Test Instruction (PTI) is enclosed.

PTI NUMBER	Rev.	TITLE
2-PTI-032-02	0	Loss of Air Test

There are no new regulatory commitments associated with this submittal. If you have any questions, please contact Nick Welch at (423) 365-7820.

Respectfully,

J. W. Shea
Vice President, Nuclear Licensing

-----------------------	-------------------------	---

1.0 INTRODUCTION

1.1 Test Objectives

- A. Verify the Auxiliary Control Air System (ACAS) Safety Related components fail to their failsafe positions in response to a gradual (decreasing) loss of system air pressure as described by design documents (2-TSD-032-2) with the exceptions identified in FSAR 14.2.7 (Conformance of Test Programs with Regulatory Guidelines) that defines individual test requirements for sudden loss of system pressure.
- B. Verify that simultaneous operation of the six highest demand loads described in 2-TSD-032-02, Att. A, supplied from each ACAS train will NOT cause unacceptable system pressure transients as described in 10CFR50, App. A, GDC-5.
- C. Verify the Control Air System (CAS) Safety Related components fail to their failsafe positions in response to a gradual (decreasing) loss of system air pressure as described by design documents.
- D. Verify that 2-HS-32-112A will activate the purge solenoids Open for the non essential CAS reactor building ONLY when 2-FCV-32-111 is position to Closed, and that designated components go to their failsafe position within the prescribed time as described in applicable design documents.

1.2 Scope

- A. The scope of this test includes the following boundaries:
 - Selected Unit 2 air operated components served by ACAS Train A & B [23] & B [25] for systems 1, 3, 32, 65, 68, & 90.
 - Selected Unit 2 air operated components served by the CAS [135] for systems 1, 3, 30, 31, 32, 43, 61, 67, 68, 74, 77, & 8.
- B. The testing will encompass:
 - Coordinating components initial pre-test and post test positions as may be impacted by unit 1/unit isolation and/or ABSCE boundary considerations.
 - Use of M&TE pressure gages for acceptance criteria [2] & baseline data [4]
 - Use of M&TE to record time of component movement & pressure changes
 - Use of plant pressure gages [4] to obtain baseline data
 - Use of temporary test connections [2] for CAS gradual loss of air testing

1.2 Scope (continued)

- Initial pre-fail safe component lineups and restoration after failsafe testing
- venting various pressure regulators and/or air lines for gradual loss of air test
- simultaneous operation of six heavy air users to plot pressure losses
- verifying failsafe positioning of air operated components
- verifying purge initiating handswitches function per design
- timing of selected components after purge initiation.
- test director's observations of vibration during component manipulations
- coordinating with operations to restore systems to support plant operations

-----------------------	-------------------------	--

3.0 PRECAUTIONS AND LIMITATIONS

- A. Standard precautions shall be followed for working around energized electrical equipment in accordance with TVA Safety Manual Procedure 1021.
- B. Steps may be repeated if all components CANNOT be tested in a step. However, if the test has been exited, prerequisite steps must be re-verified and a Chronological Test Log (CTL) entry made.
- C. Discrepancies between component ID tags and the description in a procedure/instruction do NOT require a Test Deficiency Notice (TDN) in accordance with SMP-14.0, if the UNIDs (Including Unit Specific Designators) match, exclusive of place-keeping zero's and train designators (e.g. 2-HS-31-468 vs. 2-HS-031-0468) and/or the noun descriptions are sufficient to identify the component. If the component label needs to be changed, a Tag Request Form (TR Card) should be processed in accordance with TI-12.14. Make an entry in the CTL and continue testing.
- D. All wires removed/lifted from a terminal shall be identified and taped or covered with an insulator to prevent personnel or equipment hazard and possible spurious initiations. The wires should be grouped together and labeled with the work implementing document number that required them to be lifted if left unattended. Appendix B may be used if documentation is needed.
- E. All open problems are to be tracked by a corrective action document and entered on the appropriate system punch list. SMP-9.0, Conduct of Test, provides means to address needed procedure test change notices (CNs) and test deficiency notices (TDNs).
- F. Problems identified during the test shall be annotated on the CTL from SMP-9.0 including a description of the problem, the procedure step when/where the problem was identified, corrective action steps taken to resolve the problem, and the number of the corrective action document, if one was required.
- G. Observe all Radiation Protection (RP) requirements when working in or near contaminated areas.
- H. Ensure there are NO adverse effects to the operation of Unit 1 related structures, systems, or components.
- I. Test personnel will coordinate with Operations when manipulating Unit 1 related equipment required by this test procedure.

3.0 PRECAUTIONS AND LIMITATIONS (continued)

- J. Operations will maintain operating control of the CAS and ACAS and the applicable existing lineup using SOI-32.01 and 0-SOI-32.02. Preoperational Startup Engineering, (PSE), will coordinate with Operations for lineups of systems under their jurisdiction. Lineups needed for test control and performance are within this test procedure and are temporary in nature and will be restored in this procedure. Adjustments to lineups for test control may be tracked using Appendix B, Temporary Condition Log.
- K. For test control purposes, during gradual and purge testing, valve position and/or timing verification can be accomplished by either local observation or valve position indicators at the associated locations listed within the applicable tables (See the below test table matrix).

System 32 FCV position indicator lights are required to be verified as part of Tables 2 through 16 (multiple locations: green light-close/red light-open).

Incorrect indications for system initial, prepositioning or as-left [restored] positioning will only require the generation of corrective documentation. If a listed component does NOT move to its failsafe position a TDN will be required for this procedure.

2-PTI-032-02 TEST TABLE MATRIX						
Sub section	Description [Related Handswitch]	Initial Position Table	Pre-position Table	Failsafe Position Table	Gradual Loss Table	As-Left Table
6.1	ACAS Train A Gradual [2-HS-32-81A]	2	5	7	12	12
6.2	ACAS Train B Gradual [2-HS-32-103A]	3	6	8	13	13
6.3	CAS Gradual [2-HS-32-111A]	4	9	10	11	11
6.3	CAS Purge [2-HS-32-111A/112A]	14	15	16	N/A	N/A

- L. The test method utilized for branch line testing incorporates the intent of Reg. Guide 1.68.3 (C. 8) to demonstrate a gradual loss of Unit 1 operations. Only the Unit 2 components identified in Test Scoping Document 2-TSD-032-2 are to be tested.
- M. For test control purposes, work orders are to be utilized for support personnel to simulate the gradual loss of air on the different branch lines. Except for System 30 Purge Air, the applicable branch lines will be gradually vented either at the respective pressure regulator vent valve, if vent is available, and/or by disconnecting the air supply line tube fitting(s) of the listed regulator to the extent necessary to facilitate venting.

WBN Unit 2	LOSS OF AIR TEST	2-PTI-032-02 Rev. 0000 Page 17 of 222
-----------------------	-------------------------	--

3.0 PRECAUTIONS AND LIMITATIONS (continued)

- N. For test control purposes, the System 30 purge supply fan and exhaust fan valves related test branches will use two temporary installed test connections between the existing related flow solenoid valve and its cylinder, including a bleed off valve to be gradually opened to provide a vent path. This will be accomplished using two work orders to temporarily remove the associated branch line's heavy duty red rubber hose clamped between the associated solenoid outlet and the actuator cylinder connection at 2-FCV-30-2 and 2-FCV-30-216. A non-intent Test Change Notice, TCN, will be required should another associated valve be selected at the time of testing due to a different IN plant physical access and/or configurations. Copies of the applicable work orders will be attached to the test package as listed in Section 7.0.
- O. For test control purposes, a satisfactory leak check sign off with concurrent verification will be performed as part of each test branch restoration within this test procedure's applicable tables. The associated test support work orders will have steps to ensure the restoration is also complete with any needed plant standards as applicable (e.g., torque/test gauge spacing, QA witness). Copies of the applicable work orders will be attached to the test package as listed in Section 7.0.
- P. For test control purposes, some branch line testing will temporarily isolate an associated instrument panel by closure of the System 32 air supply, to preclude the bleed off of the associated pressure or flow modulators that could be affected by gradual venting of the test branch. These isolations will help to ensure the associated control loops do not have to be re-pressurized and/or recalibrated. The panels and isolation valves are listed and addressed within the applicable subsection tables.
- Q. For test control purposes Unit 2 System 65, EGTS, Train A and Train B components will be individually tested, versus the entire branch components. This is due to the shared common header that has both the Unit 1 and common valves, whose availability allows Unit 1 to remain operational without an LCO being initiated to perform this test. If the EGTS is needed when testing of Train A or Train B is in progress, then testing should stop to allow position of the associated valves to maintain unit separation. It is expected that the most practical time to test the large diameter unit 2 system 65 valves now designated as ABSCE is when this ABSCE designation is no longer applies when Unit 2 containment is part of the present unit 1 pressure boundary or as allowed by TI-65 ABSCE breach approval process.

WBN Unit 2	LOSS OF AIR TEST	2-PTI-032-02 Rev. 0000 Page 18 of 222
-----------------------	-------------------------	--

3.0 PRECAUTIONS AND LIMITATIONS (continued)

- R. For test control purposes, normally OPEN, 2-ISV-26-3806 and 2-ISV-32- 3807 (per Table 4, CAS Initial Valve Lineup) will be CLOSED for the performance of Table 11, (CAS Gradual Loss of Air Test Branch Lineups). This will temporarily isolate the continuing supervisory control air supply to Fire Protection Deluge Valves 2-FCV-26-219 and 2-FCV-26-223, sprinkler piping via normally OPEN 2-ISV-26-620 and 2-ISV-26-621. This condition will also prevent bleed off during the associated branch line testing which will effectively trap control air within the sprinkler piping maintaining a dry condition. If the deluge valves are in service for fire protection AND if supervisory air is also evaluated to be required, then a fire impairment permit will be required to be generated BEFORE the associated branch line testing in Table 11.

- S. For test control purposes, instrument inaccuracy will be accounted for in this test, when plotting pressure data on the engineering provided curve. M&TE with accuracy of ± 0.5 psig will be used to obtain the measured pressure data. When plotting pressure data, an entry of 0.5 psig less will be used for each point for conservative test purposes. The test is written to submit the plotted curved data to engineering for evaluation regardless of results. If the recorded data falls below the data curve, then a TDN will be generated for an apparent failure to meet acceptance criteria. It should be noted, that during similar Unit 1 testing, via SPT-32-01, plotted results did not meet acceptance criteria with only five valves tested instead of six per this test.

- T. For test control purposes, when the recording of time is specified, the Main Control Room clock should be used for consistency with personal time pieces individually synchronized.

- U. For test control purposes, the simulated gradual loss of air venting of the ACAS served components will continue until a total loss of air occurs on the tested branch line as indicated by no further venting. The simulated gradual loss of air venting of the CAS system served components may be terminated, when the failsafe position has been achieved. The testing time span for venting will be determined by the Test Director for the CAS related positioner. It is expected that the Test Director will attempt venting over the longest time period that is practical with a minimum time span target of approximately 15-30 minutes when practical for test performance consistency using the test methods previously discussed. Time and pressure data will **NOT** be required to be recorded. Each branch line test venting may be repeated at the Test Director's discretion by repeating all of the applicable steps including all applicable prerequisites. Any failure of a test component to go to its failsafe position after full branch line venting will require a TDN. Any other deviation from this test control method will require a TCN.

WBN Unit 2	LOSS OF AIR TEST	2-PTI-032-02 Rev. 0000 Page 19 of 222
-----------------------	-------------------------	--

3.0 PRECAUTIONS AND LIMITATIONS (continued)

- V. During the performance of this procedure, observation (sight, sound, touch) of piping and components vibration is required by test participants. This includes steady state and transient operation, with confirmation that vibration is NOT excessive by test engineering judgment. Instrumentation readings of vibration may be obtained. If the vibration is determined to be excessive, the Test Director shall initiate a TDN.
- W. There are some current ABSCE boundary and Unit1 /Unit 2 interface point components that are addressed in this procedure that may need to be breached temporarily to establish the Unit 2 supplied controlled air flow paths for the branch testing for gradual loss of air testing. Approval for any changes to ABSCE boundary or Unit1/Unit 2 interface points will be by TI-65 or TI-12.08 process. Evaluation will occur at step 4.1[21] to assure the system have been placed in service. Tables 2, 3, and 4 provide current related identification of the related components.
- X. Annunciation at 1-XA-55-6D-136 [A] (AUX AIR COMP A ABNORMAL) or 1-XA-55-6D-137 [B] (AUX AIR TR B PRESS LO) will occur when System 32 pressures lowers to 68 psig. If the test has NOT already been stopped, then STOP TESTING before restoring system to operational status per SOI-32.01 and 0-SOI-32.02 as required. Other test limits and contingencies are listed below.
- Y. System pressure at the ACAS receivers may be monitored at their pressure indicators or M&TE, (0-PI-32-66 or 0-PI-32-89), with the CAS in service or with either ACAS Train in service. Other possible pressure monitoring locations are identified on Data Sheet 1 and 2 that also will be used during heavy user data collection in subsection 6.1 and 6.2, as discussed below.
- Z. Six M&TE pressure indicators will be installed with an accuracy of ± 0.5 psig. Installation is addressed in Section 4.0 and will require coordination with unit 1 and unit 2 operations. M&TE will be used at selected locations. Two of the indicators will be used for acceptance criteria, replacing PI's that only have a plus or minus 2 psig accuracy, and the other four, as well as two control room plant instruments, will be used to provide baseline data to be recorded on Data Sheets 1 & 2. This data may be used if needed to supplement acceptance criteria pressure indications.
- AA. Test support personnel will be stationed at M&TE to monitor test control pressures and/or at plant instrumentation. Test support personnel will be also stationed at the appropriate branch line isolation valves to reposition the respective test branch from Unit 1 as soon as data is taken or in the event that test control pressure limits are exceeded and to monitor the component positioning locally.

WBN Unit 2	LOSS OF AIR TEST	2-PTI-032-02 Rev. 0000 Page 20 of 222
-----------------------	-------------------------	--

3.0 PRECAUTIONS AND LIMITATIONS (continued)

- BB. For test control purposes, a pressure low limit of 80 psig will be used for all branch line gradual loss of air testing in Subsections 6.1, 6.2, and 6.3. Plant instrument accuracy at approximately ± 2 psig has an effective indication range from approximately 82 to 78 psig. M&TE accuracy of ± 0.5 psig has an effective indication range of 80.5 to 79.5 psig.

- CC. For test control purposes, a low pressure limit of 72 psig will apply for testing in Subsections 6.1 and 6.2, during the planned 90 second heavy user data collection period. Only the first 60 second data will be used for acceptance criteria, while the remaining data is for baseline purposes. The low pressure limit of 72 psig ensures that there is NO containment isolation which occurs at a set point of 70 psig. This test limit can be observed at any of the installed M&TE pressure indicators. Note that previous similar testing (5 different heavy users ACAS Train B only) has indicated that pressures were reduced to 83 psig, in approximately 30 seconds and continued to lower to 79 psig (with supplemental recorded data at 77 psig, but at no specific time). This data was recorded using plant instruments with the ± 2 psig accuracy, that were found during post test calibrations to be accurate to approximately 1 psig.

- DD. For test control purposes, there is NO need for any set points for System 32 compressor operations to be changed. The CAS system is isolated at 79.5 psig, allowing the ACAS system to start. Normal ACAS loading begins at 83 psig decreasing and will unload at 100 psig increasing. This will allow for normal system pressure loss recovery.

- EE. For test control purposes, AND to support Unit 1 System 65 (EGTS) operations the air supply valves, Train A, 0-ISV-32-685 and Train B 0-ISV-32-413 will remain OPEN. The initial positions are verified in Tables 2 and Table 3. If the EGTS system is needed to support Operations then Table 2 or Table 3 for Unit 2 system 65 valves will need to be restored to allow positioning to provide unit separation.

4.0 PREREQUISITE ACTIONS

NOTE

Like Subsections may be performed in parallel in full or in part prior to step sign off to facilitate test preparations including addressing any ABSCE boundary or U1/U2 interface related component. This activity should be documented in the CTL as to when any subsection is started for what related components to provide test performance clarity with appropriate date inclusion when the step is signed off if different than the heading date.

4.1 Preliminary Actions

- [1] **EVALUATE** open items in Watts Bar Integrated Task Equipment List (WITEL), and

ENSURE they will NOT adversely affect the test performance and results.
 - A. Subsection 6.1, ACAS Unit 2 Train A _____
 - B. Subsection 6.2, ACAS Unit 2 Train B _____
 - C. Subsection 6.3, CAS Unit 2 Non Essential _____

- [2] **ENSURE** changes to the references listed on Appendix A, have been reviewed, and determined NOT to adversely affect the test performance. _____

- [3] **VERIFY** current revisions and change paper for referenced drawings has been reviewed and determined NOT to adversely affect the test performance, and

ATTACH documentation of current drawing revision numbers and change paper that were reviewed to the data package. _____

- [4] **VERIFY** that the test/performance copy of this Preoperational Test Instruction (PTI) is the current revision including any change notices and, as needed, that each test person assisting in this test has the current revision including any change notices. _____

- [5] **ENSURE** special environmental conditions are available for testing if required. _____

Date _____

4.1 Preliminary Actions (continued)

- [6] **ENSURE** outstanding Design Change Notices (DCNs), Engineering Document Construction Releases (EDCRs) or Temporary Modifications (T-Mods) do NOT adversely impact testing, and

ATTACH documentation of DCNs, EDCRs, and T-Mods that were reviewed to the data package. _____
- [7] **ENSURE** by review of the component test matrix PRIOR to start of test that Component Testing (GTI-02 AOV functional or equivalent) has been completed satisfactorily for failsafe testing acceptance criteria for the components listed in the below tables as follows:

 - A. Subsection 6.1, ACAS Train A, Table 7 _____
 - B. Subsection 6.2, ACAS Train B, Table 8 _____
 - C. Subsection 6.3, CAS Table 10 & 16 _____
- [8] **OBTAIN** copies of the applicable forms from the latest revision of SMP-9.0 and

ATTACH to this PTI for use during the performance of this PTI. _____
- [9] **VERIFY** System 32, Control Air System, is under jurisdictional control of the Startup Test Group (SUT) and/or Plant Operations. _____
- [10] **ENSURE** Component Test Matrix Generic Tracking Report has been evaluated and outstanding component test exceptions will NOT impact test start.

 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____
- [11] **ENSURE** a review of outstanding Clearances has been coordinated with Operations for impact on the test performance, and

RECORD in Appendix B, Temporary Condition Log if required. _____

WBN Unit 2	LOSS OF AIR TEST	2-PTI-032-02 Rev. 0000 Page 23 of 222
-----------------------	-------------------------	--

Date _____

4.1 Preliminary Actions (continued)

- [12] **VERIFY** plant instruments required for test performance, listed on Appendix C, Permanent Plant Instrumentation Log, have been verified to be filled, vented, placed in service (as required), and are within their calibration interval.

 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
- [13] **VERIFY** Measuring and Test Equipment (M&TE) required for test performance has been recorded on Measuring and Test Equipment (M&TE) Log, Table 1.

 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____
- [14] **VERIFY** M&TE calibration due dates will support the completion of this test performance.

 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____
- [15] **VERIFY** System cleanness, as required for the performance of this test, has been completed in accordance with SMP-7.0 for the piping systems PRIOR to starting Subsections.

 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____
- [16] **PERFORM** a pretest walk down on equipment to be tested to ensure NO conditions exist that will impact test performance.

 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____

Date _____

4.1 Preliminary Actions (continued)

- [17] **ENSURE** the necessary Test Support Personnel are available.
 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____

- [18] **CONDUCT** a pretest briefing with Test and Operations personnel in accordance with SMP-9.0.
 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____

- [19] **ESTABLISH** communications in areas where testing is to be conducted.
 - A. Subsection 6.1 _____
 - B. Subsection 6.2 _____
 - C. Subsection 6.3 _____

- [20] **ENSURE** 120vac Vital Power is available (breakers closed and fuses installed) for Unit 2 isolation valves and dump (purge) solenoid valves including fuses [installed] as follows:
[Dwg: 2-45W600-32]
 - A. Subsection 6.1, 2-FCV-32-81, BD 2-III, BKR 41 _____
 - B. Subsection 6.2, 2-FCV-32-103, BD 2-IV BKR 36 _____
 - C. Subsection 6.3, 2-FCV-32-111, BD 2-IV, BKR 36 _____

NOTE

Purge Dump solenoid electrical power isolation, BD 2-IV, BRK 12, will be opened and closed in Subsection 6.3 steps [19] and [22] respectively, for test control purposes.

- D. Subsection 6.3, Solenoid Valves, BD 2-IV BKR, 12 _____
- E. Subsection 6.3, Two Fuses, 2-FU-235-4/F12 _____

Date _____

4.1 Preliminary Actions (continued)

NOTES	
1)	Each subsection has a corresponding branch related valve(s) to be tested for failsafe positioning on a gradual loss of air. Each test branch line to be gradually vented is individually isolated from the rest of the system. Drawing series 2-47W848 can be reviewed to determine which components could be impacted by testing. Test Branch Testing Tables 11, 12, & 13 list the applicable drawing sheet / coordinates. Initial lineup Tables 2, 3, & 4 also list the associated vents, drains and spares to be verified as CLOSED.
2)	Each subsection branch line's initial lineup and charging may supply some adjacent components (NOT to be tested). The test method employed does NOT require these related components. System 32 proper operation requires that these related components are NOT excessively leaking by disconnection, have faulty performance or have broken lines. These unneeded Unit 2 system components will remain under the control of the Startup Test Engineer and/or Operations and may be placed in service or isolated as required to support plant operations.
3)	Part of the requirement of Step 4.1[21] is to ensure that there is NO impact to this test or NO impact to an unneeded component by the performance of this test. Appendix B, Temporary Condition Log may be used to isolate/restore any needed air supply, and the Chronological Test Log, (CTL), to record pertinent clarifications. This may apply to some branch lines having valves or panels that are NOT to be tested. This action will ensure that system configuration is controlled as applicable using this test procedure.
4)	Some components listed in initial line up Tables 2, 3 and 4 are now ABSEC boundary or Unit 1 / Unit 2 interface points and may require approval per the processes of TI-65 or TI-12.08 in order for their positions to be changed temporarily for testing purposes. These boundary or interface points may have changed at the time of the test with components added or deleted. This will require a reviewed of the applicable documents such as drawings, boundary tags, interface tags, clearance tags or by walkdown.

[21] **ENSURE** the following systems have been place in service to the extent necessary to perform each listed Subsection, and

ENSURE that any system component that may receive an air supply on a branch line to be tested is isolated and/or will NOT be impacted by having the air supply available.

System Number	System Description	Subsection 6.1	Subsection 6.2	Subsection 6.3

4.2 Special Tools, Measuring and Test Equipment, Parts, and Supplies

NOTES	
1)	For Subsections 6.1 and 6.2 one stopwatch will be required for each ACAS Train's related acceptance criteria timing, to plot pressure data. Additional stopwatches are desired at remote locations if sequential timing announcement is NOT practical.
2)	For test purposes Section 6.3, twenty one (21) stopwatches are required for purge venting timing. The acceptance criteria for the timing of nine valves is less than or equal to sixty second, and for the remaining twelve valves, the acceptance criteria is less than or equal to 120 minutes (it is expected that these valves and dampers will open in significantly less time). Procedure steps will allow using additional stopwatches or to reset a stopwatch to record total elapse time GREATER than 60 minutes for any component. An announcement of the start of the purging venting will be made.
3)	The digital stopwatches CANNOT be calibrated. A post test accuracy check may be performed.
4)	M&TE usage is also required to be recorded in Table 1 for Subsections 6.1, 6.2 and 6.3. Stopwatch usage will also be recorded on Table 16 for Subsection 6.3.
5)	Plant Instrumentation listed in Appendix C will be used for baseline qualification data and they do NOT require any post test calibration verification of accuracy.

[1] **OBTAIN** six M&TE Pressure Indicators of a desired range of 0-150 psig (0-200 psig max) and equivalent accuracy of plus or minus 0.5 psig Full Scale. [for subsection 6.1 and 6.2] _____

[2] **OBTAIN** enough M&TE Stopwatches to perform each Subsection 6.1, 6.2, and 6.3 effectively and each stopwatch with a range from 0 to 60 minutes (0-59 minutes and 59 seconds) and equivalent accuracy of plus or minus 0.1 second or less.

5.0 ACCEPTANCE CRITERIA

- [1] The Auxiliary Control Air System Safety Related Valves listed in Table 7 and Table 8 fail to their failsafe positions on a gradual decreasing air pressure.
 - A. ACAS Train A (Step 6.1[17], Table 7)
 - B. ACAS Train B (Step 6.2[17], Table 8)

- [2] The simultaneous stroking of six engineering selected valves for each train of the Auxiliary Control Air System, when plotted on an engineering supplied time / pressure curve, is within the identified acceptable area.
 - A. ACAS Train A (Step 6.1[39], Figure 1)
 - B. ACAS Train B (Step 6.2[39], Figure 2)

- [3] The Safety-Related Valves listed in Table 10 fail to their failsafe position on a gradual loss of Control Air system pressure. (Step 6.3[13])

- [4] The Non-Essential Unit 2 Reactor Building Control Air System header purge solenoids: 2-XSV-32-112A1 & 2-XSV-32-112A2, and 2-XSV-32-112B1 & 2-XSV-32-112B2 downstream from 2-ISV-32-1337 and 2-ISV-32-1339, respectively will:
 - A. Remain in the CLOSED position with containment isolation valve 2-FCV-32-111 in the OPEN position and handswitch 2-HS-32-112A in OPEN. (Step 6.3[24])
 - B. Go to the OPEN position with containment isolation valve 2-FCV-32-111 in the CLOSED position and handswitch 2-HS-32-112A in OPEN. (Step 6.3[27])
 - C. Go OPEN, allowing the associated valves to obtain failsafe within the desired time as listed in Table 16, (Step 6.3[28])

Date _____

**6.1 Train A Auxiliary CAS Gradual Loss of Air & Heavy User Testing
(continued)**

NOTES
<p>1) Steps 6.1[4] and 6.1[5] ensure that both trains of the ACAS system remain available.</p> <p>2) Observations for indications of excessive vibration will be performed during this subsection.</p> <p>3) Not all unit 1 and unit 2, including common, components served by the ACAS Train A compressor will be isolated by this subsection in order to remain available if required to support current plant operations.</p>

[4] **ENSURE** that the ACAS Train A compressor A-A selector switch 0-HS-32-60, AUX AIR COMPR A-A MODE SELECTOR, is in AUTO at 0-L-321 [757/A7U]. _____

[5] **ENSURE** that the ACAS Train B compressor B-B selector switch 0-HS-32-86, AUX AIR COMPR B-B MODE SELECTOR, is in AUTO at 0-L-322 [757/A9U]. _____

[6] **OPEN** 2-BYV-32-328, ESSENT CONTROL AIR 2-FCV-32-81 BYPASS [702/301] to provide an air flow path for upcoming venting. _____

[7] **NOTIFY** Operations that Step 6.1[8] will isolate the CAS from the ACAS Train A, and that the ACAS Train A compressor will be allowed to load and unload before branch line testing in this Subsection. _____

NOTE
<p>Step 6.1[8] isolates air delivery from the operating CAS system to the ACAS Train A Receiver, 0-RCVR-32-62, and allows automatic start of the Train A as pressure is lost from the downstream lines/users. The A Train ACAS Compressor will begin loading at approximately 83 psig, and unload at approximately 100 psig. Receiver pressure data, including start and stop loading data, is for baseline information only.</p>

[8] **PLACE** 0-HS-32-82, ESSENT CONTROL AIR TR A NORM FLOW ISOL, at 0-JB-292-1174-A [757/A7U], to the CLOSE position to provide initial isolation between the CAS and ACAS Train A, and

VERIFY 0-FCV-32-82, ESSENT CONTROL AIR TR A NORM FLOW ISOL, is CLOSED by indication at 0-HS-32-82. _____

NOTES
1) Steps 6.1[10] through 6.1[17], will be repeated for each branch line's gradual loss of air testing. Branch testing may be performed in any order and multiple branch lines may be performed simultaneously, provided Steps 6.1[10] through 6.1[17] are performed sequentially.
2) Table 2 will have been performed as a prerequisite to charge the system and position the related valves to the As Found position for the gradual loss of air testing.
3) Table 5 will be used to pre-position the related components being tested for failsafe positioning prior to venting to simulate a gradual loss of air. The listed controllers may also be used for restoration purposes.
4) Table 12 will be used to set up and perform the gradual loss to total loss of air testing, including the documentation of the restorations and leak checks.
5) Table 7 will be used to verify the failsafe positions achieved/NOT achieved for any component on the test branch.

- [10] **ENSURE** INITIAL As Found position of related System 32 isolation valves and other system valves are as listed on Table 12. _____
- [11] **POSITION** each test branch component controllers to their pre-failsafe position as listed on Table 12 using Table 5. _____
- [12] **POSITION** System 32 and other system related isolation valves for each test branch line to be tested using Table 12. _____
- [13] **INITIATE** VENTING of each test branch for a gradual loss of air as listed in Table 12. _____
- [14] **INITIATE** VERIFICATION of each system component(s) failsafe position after venting using Table 7. _____
- [15] **INITIATE** RESTORATION of each System 32 related isolation valve and pressure regulator and/or connections after venting to their As Left position as listed on Table 12. _____
- [16] **INITIATE** RESTORATION of each component valve after venting to their As Left position as listed on Table 12 using the controllers listed on Table 5. _____

CAUTIONS

- 1) The following Steps 6.1[18] through 6.1[29] is a first time iteration of this test method for Unit 2 where Unit 1 components may be in service.
- 2) Heavy user testing will begin at a pressure of 89.5 psig with low pressure limit of 72 psig. This provides for test control to the extent that NO actuation of containment isolation will be expected.
- 3) Steps 6.1[18] through 6.1[22] is delineated below to ensure coordination with Unit 1 and Unit 2 Operations to ensure that appropriate contingencies are in place BEFORE stroking the valves simultaneously.

NOTES

- 1) This Subsection will stroke six Unit 2 heavy air user components simultaneously. A like test method was used for Unit 1 stroking of five heavy users on only ACAS Train B with NO report for any impact to the plant within the test document.
- 2) Control Room indicators at 2-M-4 are acceptable for verifying valve positions.

[18] **ENSURE** by coordination with Startup Engineering and Operations that systems listed at Step 4.1[21] for Subsection 6.1 are in a condition to support Unit 2 testing. _____

6.3 CAS Gradual Loss of Air & RB Header Purge Failsafe Testing

NOTE

The CAS system includes common, Unit 1 and Unit 2 components. Step 6.3[2] valve lineup allows control air charging of the Unit 2 components to be tested.

- [1] **ENSURE** the CAS system is in service to support plant operation. _____
- [2] **VERIFY** prerequisites listed for Subsection 6.3 have been completed, including Subsections 4.1, and 4.2. _____

NOTES

- 1) Steps 6.3[3] and 6.3[4] ensure the both trains of the ACAS system remain available.
- 2) Observations for indications of excessive vibration will be performed during this subsection.

- [3] **ENSURE** that the ACAS Train A compressor A-A selector switch 0-HS-32-60, AUX AIR COMPR A-A MODE SELECTOR, is in AUTO at 0-L-321 [757/A7U]. _____
- [4] **ENSURE** that the ACAS Train B compressor B-B selector switch 0-HS-32-86, AUX AIR COMPR B-B MODE SELECTOR, is in AUTO at 0-L-322 [757/A9U]. _____
- [5] **OPEN** 2-BYV-32-338, CONTROL AIR 2-FCV-32-111 BYPASS, [716/297] to provide an air flow path for upcoming venting. _____

Date _____

**6.3 CAS Gradual Loss of Air & RB Header Purge Failsafe Testing
(continued)**

NOTES
<p>1) Steps 6.3[6] through 6.3[13], will be repeated for each branch line gradual loss of air testing. Branch testing may be performed in any order and multiple branch lines may be performed simultaneously, provided Steps 6.3[6] through 6.3[13] are performed sequentially.</p> <p>2) Table 4 will have been performed as a prerequisite to charge the system and position the related valves to the As Found position for the gradual loss of air testing.</p> <p>3) Table 9 will be use to pre-position the related components being tested for failsafe positioning prior to venting to simulate a gradual loss of air. The listed controllers may also be used for restoration purposes.</p> <p>4) Table 11 will be used to set up and perform the gradual loss of air testing, including the documentation of the restorations and leak checks.</p> <p>5) Table 10 will be use to verify the failsafe positions achieved or NOT achieved for any component on the test branch.</p>

[6] **ENSURE** INITIAL As Found position of related System 32 isolation valves and other system valves are as listed on Table 11. _____

[7] **POSITION** each test branch component controllers to their pre-failsafe position as listed on Table 11 using Table 9. _____

[8] **POSITION** System 32 and other system related isolation valves for each test branch line to be tested using Table 11. _____

CAUTION

There are some common and Unit 1 related components to be considered prior to branch line test performance.

[9] **INITIATE** VENTING of each test branch for a gradual loss of air as listed in Table 11. _____

[10] **INITIATE** VERIFICATION of each system component(s) failsafe position after venting using Table 10. _____

- [11] **INITIATE** RESTORATION of each System 32 related isolation valve and pressure regulator and/or connections after venting to their As Left positions listed on Table 11. _____
- [12] **INITIATE** RESTORATION of each component valve after venting to their As-Left position as listed on Table 11 using the controllers listed on Table 9. _____
- [13] **VERIFY** CAS components moved to their failsafe position after venting using Table 10. **[Acc. Crit. 5.0[3]]** _____

NOTES
1) Considerations for isolation or pre-positioning of other system valves NOT controlled by this Subsection's purge testing will be addressed as part of Steps 6.3[14] and 6.3[15].
2) Observations for excessive vibration will be performed during this Subsection.

- [14] **COORDINATE** with Startup Engineering and Operations to ENSURE that systems listed at Step 4.1[21] for Subsection 6.3 are in a condition to support this subsection. _____
- [15] **COORDINATE** with Operations to ENSURE that the CAS is in service to the extent necessary to support Unit 2 Purge Solenoid testing [Steps 6.3[17] to [30]. _____
- [16] **OBTAIN** authorization to perform this subsection from Operations: _____
 - A. Unit 1 Operations
Name/Title: _____ / _____
 - B. Unit 2 Operations:
Name/Title: _____ / _____
- [17] **PERFORM** Table 14, CAS U2 RB Header Purge Initial System 32 Lineups. _____

Date _____

**6.3 CAS Gradual Loss of Air & RB Header Purge Failsafe Testing
(continued)**

[24] **PLACE** 2-HS-32-112A to OPEN, and

VERIFY U2 CNTMT NON-ESSENTIAL HEADER DUMP SOLENOID VALVES did **NOT** OPEN (Remained CLOSED) by Green Light ON and Red Light OFF indication:

[Acc. Crit. 5.0[4]A]

- A. 2-XSV-32-112A1 _____
- B. 2-XSV-32-112A2 _____
- C. 2-XSV-32-112B1 _____
- D. 2-XSV-32-112B2 _____

NOTE

Twelve of the listed valves to be timed for failsafe positioning have an acceptance criteria of less than or equal to 120 minutes which is 60 minutes beyond the stopwatches range specified and may require an additional stopwatch or the resetting of a stop watch to record total time. Nine stopwatches will be used for timing of the acceptance criteria of less than one minute and may be available for backup sequential timing of some of the twelve valves mentioned above. Timing will begin at the same time with an announcement to test personnel. . A minimum of 21 stopwatches are required. Step 6.3[25] may be completed after all stopwatch usage has occurred.

[25] **ENSURE** that M&TE digital stopwatches to be used for purge timing are recorded in both Table 1 for calibration data and Table 16 to identify which stopwatch is used for each component's timing for traceability. _____

Date _____

**6.3 CAS Gradual Loss of Air & RB Header Purge Failsafe Testing
(continued)**

CAUTIONS

- 1) Step 6.3[26] will energize the purge solenoids in Unit 2 Reactor Building causing all components to bleed off and go to their failsafe position if NOT already in that position or if NOT isolated by closing the associated CAS isolation valve.
- 2) For PERSONNEL SAFETY considerations, BEFORE the performance of Step 6.3[26] personnel need to stand clear of the bleed off of the purge solenoid valves (ACC. Rm. 4 [721/298]) and the valves listed in Table 16. Appropriate flagging and/or other area physical blocking techniques may be employed. Goggles and double ear protection PPE may be desirable if personnel are near the purge solenoid air exhaust ports. This is also addressed at Step 4.1[27].

NOTE

Communication of the performance of Step 6.3[26] is required for test personnel to begin the failsafe timing for purge vent testing.

[26] **PLACE** 2-HS-32-111, in the CLOSED position
[Green light ON and Red Light OFF]. _____

[27] **VERIFY** U2 CNTMT NON-ESSENTIAL HEADER DUMP
SOLENOID VALVES are OPEN,
by Green Light OFF and Red Light ON
for the following solenoid valves at 2-M-23A,
[Acc. Crit. 5.0[4]B]

A. 2-XSV-32-112A1 _____

B. 2-XSV-32-112A2 _____

C. 2-XSV-32-112B1 _____

D. 2-XSV-32-112B2 _____

[28] **VERIFY** that the valves listed in Table 16 go to their failsafe
position within the desired time specified. **[Acc. Crit. 5.0[4]C]** _____

[29] **PLACE** 2-HS-32-112A to the CLOSED position, and

VERIFY Green Light ON and Red Light OFF
for the following solenoid valves:

A. 2-XSV-32-112A1 _____

NOTES

- 1) The isolation of the panels noted below will occur after prepositioning of the related component valves to be tested for failsafe and the opening of the listed valves for later restoration is addressed in Tables 5 & 12.
- 2) This line up is to be ensured by startup engineering or operations as part of their jurisdiction. This requirement is included at prerequisite steps 4.1[21].
- 3) Valves are shown on Control Air Flow Diagrams 2-47W848 sheets 1 & 10. [e.g., 1-G/8 typically denotes sheet 1 coordinates G & 8 and E/3 typically denotes drawing sheet 10 at coordinates E & 3]S
- 4) 2-HS-32-081A is to be placed to OPEN at 2-M-15. Verify 2-FCV-32-81 Handswitch indication of Red Light ON & Green Light OFF.
- 5) The components description referring to ABSEC boundary or Unit 1/Unit 2 interface (U1/U2) may require approval to change via the TI-65 or TI-12.08 processes. This is delineated by prerequisite step 4.1 [21] for placing the applicable components in service. Precaution and Limitations of section 3.0 provides additional clarification for test control purposes.

NOTES

- 1) This Table supports prerequisite Step 4.1[21] for Startup Engineering And/Or Operations to consider other system valves that are NOT addressed below such as those lines designated in brackets as "mixed" and "multiple".
- 2) The isolation and restoration [via Table 11] of the panel isolation valves listed below occurs after preposition [via Table 9].
- 3) The valves are shown on Control Air Flow Diagrams 2-47W848 series on sheets indicated at the coordinates provided below.
- 4) This line up also requires that when verifying the line isolation valve to a component that may have a pressure regulator that its vent is closed and that the tubing is connected to the associated components to support testing in Table 11.
- 5) 2-HS-32-11A placed to OPEN at 2-M-15. Verify 2-FCV-32-111 Handswitch indication of Red Light ON / Green Light OFF.
- 6) The components description referring to ABSEC boundary or Unit 1/Unit 2 interface (U1/U2) may require approval to change via the TI-65 or TI-12.08 processes. This is delineated by prerequisite step 4.1 [21] for placing the applicable components in service. Precaution and Limitations of section 3.0 provides additional clarification for test control purposes.

NOTES

- 1) Individual positioning may be performed in any order in conjunction with the performance of branch testing via Table 11. Components vented will be restored first.
- 2) For MFW listed valve positioning of 2-FCV-3-236, -239, -242, & 245: first go to RESET using both selector switch and pushbutton 2-HS-99A1 & A2 at 2-M-3, then take 2-HS-3-945A to the ON position inside 2-JB-292-8205 [125 VDC Battery Room III, A10Q/757]. Valve position may be verified at 2-M-3 status lights [2-XI-3-236, 239, 242 & 245] or locally at North or South Valve Rooms [A15X/729 or A15U/729].
- 3) The tracking of the adjustment of Pressure Controllers (PC's, PIC) within this Table will be accomplished using Appendix B, Temporary Condition Log for recording the As Found, As Adjusted, and As Left (restored to As Found) positions. The pressure setting knob inside the controller assembly is to be rotated clockwise (CW) to increase and counterclockwise to decrease the set point.
- 4) Some components listed in this Table are under Unit 1 control and required coordination with Unit 1 Operations.

CAS Gradual Loss of Air Test Branch Lineups

Date _____

NOTES

- 1) Initial system 32 related isolation valve open position verified in Table 4. The repositioning of multiple system control valves is initially verified using Table 9. Some of the valves are listed below again for test control, consistency, and clarity purposes. Bold lines between table rows indicate a particular test branch for gradual loss of or air testing.
- 2) Position component as indicated to vent and test branch line. Acceptance Criteria position in bold indicates sign off in Table 10.
- 3) Restoration to the As Left position will be by manual positioning or using controllers listed in Table 9. A site approved air leakage indicator shall be used to ensure no leakage of control air supply after restoration of pressure regulator or tubing.
- 4) Initial restoration for this procedure's purposes will be to the As Left position will be by manual positioning or using controllers listed in Table 9. Startup Engineering and/or Operations may elect to re-position any component after the As Left position is obtained as listed such as ABSCE boundary, U1/U2 interface, or individual system operation/isolation. The Bypass Isolation valve 2-BYP-32-338 should be Closed when 2-FCV-32-111 is Open [may be documented at 7.0 step [8] C. The Final Restoration for all systems tested is addressed in section 7.0.
- 5) Before starting a test branch iteration, ensure that the component being tested for failsafe positioning may be adjusted to the preposition plus allowing it to go to its failsafe position as not to impact any current plant condition by coordination with startup and/or operations. For example all of the system 30 valves listed below are part of the Unit 2 containment purge supply and exhaust system [drawings 2-47W610-30-1 & 1A] and may be needed in part or full to support plant purge operations.
- 6) Drawing Reference is from applicable 2-47W848-series. [e.g., 9-F/8 denotes sheet 9 drawing coordination F and 8.]
- 7) A Fire Impairment Permit may be required when Supervisory Air is isolated to 2-FCV-26-219 and 2-FCV-26-223 when in service.

NOTES

- 1) Initial isolation valve open position and with related pressure regulator vent closed is verified in Table 2. Some of the valves are listed below again for test control, consistency, and clarity purposes. The repositioning of control valves verified using Table 5. Turned over Unit 1 and common components are normally open for flow.
- 2) Portions of Unit 2 System 65, EGTS, will temporarily NOT be available during portions of this test subsection.
- 3) Position component[s] as indicated to gradually vent test branch line for a total air lost. Acceptance Criteria position in **bold** indicates sign off in Table 7.
- 4) Initial restoration for this procedure's purposes will be to the As Left position by manual positioning or using controllers listed in Table 5. Bypass Valve 2-BYP-32-328 should be positioned Closed when 2-FCV-32-81 is Open. This may be documented in 7.0 Step [8]A. Startup Engineering and/or Operations may elect to re-position any component after the As Left position is obtained as listed such as ABSCE boundary, U1/U2 interface, or individual system operation/isolation. Final Restoration for all systems tested is addressed in Section 7.0.
- 5) Drawing reference is from 2-47W848-sheet 10. [e.g., F/8 denotes sheet 10 drawing coordinates F & 8].
- 6) Essential Air EL 757 AB Hdr Isolation Valve 0-ISV-32-385 will need to remain OPEN as positioned in Table 2 to support Unit 1 operation and to restore the Unit 2 System 65 valves tested individually below.

NOTES

- 1) Initial isolation valve open position and position with related pressure regulator vent closed is verified in Table 3. Some of the valves are listed below again for test control, consistency, and clarity purposes. The repositioning of control valves verified using Table 6. Turned over Unit 1 and common components are normally open for flow.
- 2) Portion of Unit 2 System 65, EGTS, will temporarily NOT be available during portions of this test subsection.
- 3) Position component as indicated to gradually vent test branch line for total loss of air. Acceptance Criteria position in **bold** indicates sign off in Table 8.
- 4) Initial restoration for this procedure's purposes will be to the As Left position by manual positioning or using controllers listed in Table 6. Bypass Valve 2-BYP-32-318 should be positioned to Closed when 2-FCV-32-103 is Open. This may be documented in 7.0 Step [8] B Startup Engineering and/or Operations may elect to re-position any component after the As Left position is obtained as listed such as ABSCE boundary, U1/U2 interface, or individual system operation/isolation. Final Restoration for all systems tested is addressed in Section 7.0.
- 5) Drawing reference is from applicable 2-47W848 sheet 10. [e.g., F/8 denotes sheet 10 drawing coordination F and 8.]
- 6) Essential Air EL 757 AB Branch Header Isolation Valve 0-ISV-32-413 will remain OPEN as positioned in Table 3 to support Unit 1 operation and to restore the Unit 2 system 65 valves tested individually below.

NOTES

- 1) This lineup is to ensure air charging and bleed off purging of valves listed on Table 16 for failsafe verification.
- 2) Before the performance of purge failsafe testing, coordination with Startup Engineering and/or Operations to ensure that purging will NOT adversely impact other system's operation NOT to be tested by this procedure [Ref steps 6.3[14], [15], [16].
- 3) Drawing 2-47W848-9 Coordinates listed below may be reviewed for coordination purposes.

NOTES

1) Before the performance of purge failsafe testing, ensure by coordination with Startup Engineering and/or Operations that purging will NOT adversely impact other system's operation NOT to be tested by this procedure [Ref. Steps 6.3[14], [15], [16].

2) This lineup uses only auxiliary control room panel's switches for test control purposes which bypasses the alternate automatic permissive control loops. Restoration Step 6.3[32] should NOT be delayed after purge verification results. Operations may reposition switches after performance of Step 6.3[32] to support plant operations and maintain configuration control.

3) The locations delineated in this Table support the failsafe verification for Table 16.

Controller Position Location	Controller Description	Associated Component Location	Generic Description	Pretest Position	Initial/Date

NOTE

Tables 14 & 15 delineate the initial valve lineup & pre-positioning of the controller locations needed to support this table.

Valve/Operator	M&TE ID Number	Generic Description	Designed FAILSAFE	Actual FAILSAFE	Desired TIME	Actual TIME	Initial/Date
2-FCV-62-69		RC Loop 3 Letdown Flow	CLOSED		≤ 1 min.		
2-FCV-62-70		RC Loop 3 Letdown Flow	CLOSED		≤ 1 min.		
2-FCV-62-72		Regent Ht Exch Letdown Isol Vlv A	CLOSED		≤ 1 min.		
2-FCV-62-73		Regent Ht Exch Letdown Isol Vlv B	CLOSED		≤ 1 min.		
2-FCV-62-74		Regent Ht Exch Letdown Isol Vlv C	CLOSED		≤ 1 min.		
2-FCV-62-9		RCP 1 Seal Leakoff Flow Control	OPEN		≤ 1 min.		
2-FCV-62-22		RCP 2 Seal Leakoff Flow Control	OPEN		≤ 1 min.		
2-FCV-62-35		RCP 3 Seal Leakoff Flow Control	OPEN		≤ 1 min.		
2-FCV-62-48		RCP 4 Seal Leakoff Flow Control	OPEN		≤ 1 min.		
2-TCV-67-84		Lower Cntrmt Vent Clr 2A Temp Cntl	OPEN		≤ 120 Min.		
2-TCV-67-85		Control Rod Drive Vent Cooler A	OPEN		≤ 120 Min.		
2-TCV-67-92		Lower Cntrmt Vent Clr 2C Temp Cntl	OPEN		≤ 120 Min.		
2-TCV-67-93		Control Rod Drive Vent Clr C Temp	OPEN		≤ 120 Min.		
2-TCV-67-100		Lower Cntrmt Vent Clr 2B Temp Cntl	OPEN		≤ 120 Min.		
2-TCV-67-101		Control Rod Drive Vent Clr B Temp	OPEN		≤ 120 Min.
