

Reference: Docket 70-143; SNM-124

Gentlemen:

In accordance with Condition 61, Amendment No. 6 and Condition 67, Amendment No. 9 of SNM-124, this report is submitted on the airborne radioactivity concentrations released from plant stacks for the month of March, 1983.

The attachments list the concentrations from the major stacks. Building 233 stack was in excess of the reporting limit for the first three days of the month. The Building 233 stack was shut down on March 12, 1983. The new process ventilation system for Building 233 was started up on March 25, 1983. Attachment I lists the concentrations for both the old and new process stacks.

Attachment III lists the concentrations for the Building 302 **provide** stack. The concentrations for this stack were in excess of the reporting limit for nine days during the month. Higher than normal temperatures have resulted in damage to the stack sampling equipment. The recirculating scrubber water pump was changed out on April 13, 1983 in an effort to reduce the stack discharge temperature. On two occassions, the support brackets for the sampling probe failed causing the probe to rest against the inside of the stack. These problems were corrected the same day they were discovered.

All other stacks were below the Condition 61 reporting limit for the month of March.

Very truly yours,

₩ C. Manser, Jr., General Manager
