Table 3. Summary of Bend and High-Potential-Withstand Tests

SPECIMEN NUMBER	VISUAL APPEARANCE BEFORE AND DURING BEND TEST ^a	MANDREL DIAMETER (in)/(mm)	MANDREL/ CABLE DIAMETER RATIO	NUMBER OF CABLE TURNS	APPLIED ALTERNATING POTENTIALD (V)	LEAKAGE/ CHARGING CURRENT (mA)	REMARKS
1-1	Many rust-colored markings with white chemical deposit overall. No apparent cracks or tears.	4/102	40	8		7	
1-2	Same as for specimen 1-1.	4/102	40	7	1600	\ <10.0	Withstood potential. (Specimens connected
1-3	Same as for specimen 1-1.	4/102	40	7	(together for test.)
1-4	Same as for specimen 1-1.	4/102	40	9		ال	
2-1	Same as for specimen 1-1.	6/152	40	6		7	
2-2	White chemical deposits overall. No apparent cracks or tears.	6/152	40	7	2400	\ -10.0	Withstood potential. (Specimens connected together for test.)
2-3	Same as for specimen 1-1.	6/152	40	5			,
2-4	Same as for specimen 1-1.	6/152	40	8			
3~1	White chemical deposits overall. No apparent cracks or tears.	16/406	40	2	3600	10.0	Withstood potential. (Specimens connected
3-2	Same as for specimen 3-1.	16/406	40	2			together for test.)
3-3	Same as for specimen 3-1.	16/406	40	2			
4-1	Rust-colored markings approximately 2 in (50 mm) in length. White chemical deposits overall. No apparent tears or cracks.	5/127	38.5	6	2400	710.0	Withstood potential. (Specimens connected
4-2	White chemical deposits overall. No apparent *cracks or tears.	5/127	38.5	7			together for test.)
5-1	Outer jacket missing for approximately 14 in (0.35 m) of length at one end of cable. No apparent cracking of conductor insulation. White chemical deposits overall.	10/254	40	4	1200	<10.0	Withstood potential. (Note c)
5-2	Outer jacket missing from one-half of the specimen length. Other appearances the same as specimen 5-1.	10/254	40	4	1200	See Remarks	Leakage/charging current was 650 mA for first minute and then decreased to an average of 300 mA for remaining 4 min. The potential was maintained. (Note c)
6-1	Longitudinal cracks in outer jacket along entire length. No apparent cracking of conductor insu- lation. White chemical deposits overall.	24/610	40	2	2400	<10.0	Withstood potential. (Note d)
6-2	Same as specimen 6-1 except for the addition of circumferential cracks in the outer jacket.	24/610	40	2	2400	<10.0	Withstood potential. (Note d)
7	Outer jacket missing from most specimens. Conductor insulation appears intact. The ends of the heat-shrinkable splice were cracked (on the surface) for a distance of 2 in (50 mm). (Note e)	24/610	36.4	2	(2400)	<10.0	Withstood potential. (Note d)

NOTES:

- a. Specimens were removed from the test vessel by cutting the specimens off just below (inside) the vessel penetrations. Visual inspection and high-potential withstand test results do not include portions of specimens contained within the penetrations.
- b. Potentials applied for 5 min after specimens had been immersed in room-temperature tap water for 1.0-h minimum. The ground terminal of the test instrument was connected to a bare copper conductor in the water.
- c. Potential applied to conductors 1 and 2 connected together with the drain wire and water at ground potential.
- and water at ground potential.
 d. Potential was applied for 5 min to alternate outer conductors (i.e., 3, 5, and 7 connected together) with other conductors (i.e., 1, 2, 4, and 6) at ground potential. Then the potential was applied to the remaining outer conductors (i.e., 2, 4, and 6 connected together) with all other conductors at ground potential. Conductor 1 was always at ground potential.
- e. Technician's inspection report indicated splice was "cracked." Later examination of photographs suggested cracks were limited to the surface of the splice and did not extend through the splice material. Specimen not available for reinspection.
