### **NRC to Discuss Millstone Nuclear Plant Annual Assessment During March 29th Meeting with Conn. Nuclear Energy Advisory Council**

The Nuclear Regulatory Commission will meet with the Connecticut Nuclear Energy Advisory Council (NEAC) on Tuesday, March 29, to discuss the agency’s annual review of safety performance at the Millstone nuclear power plant, located in Waterford, Conn.

The meeting will begin at 6 p.m. at Waterford Town Hall, at 15 Rope Ferry Road in Waterford, Conn. Prior to the meeting’s adjournment, attendees will have an opportunity to ask questions of NRC staff regarding the 2015 assessment.

The NRC’s Reactor Oversight Process is the foundational program that enables the agency to successfully complete its mission of assessing plant safety. Under that program, the NRC gauges plant performance through the use of color-coded inspection findings and performance indicators, which are statistical measurements of plant performance that can trigger additional oversight if exceeded.

Based on its 2015 reviews, the NRC determined that Millstone, which is the site of two operating reactors owned by Dominion, was operated safely during 2015. As of the end of last year, Millstone Unit 2 had no inspection findings or performance indicators that were greater than “green” (very low safety significance).

Millstone Unit 3 had no performance indicators that were “greater than green,” but it did have one open “greater than green” security-related inspection finding that was identified in early 2015. However, the NRC performed a supplemental inspection at Unit 3 in late 2015 to review Dominion’s root cause evaluation and any corrective actions and found the company’s response to be satisfactory. Therefore, the NRC closed out the finding as of the first quarter of 2016.

Both Millstone Units 2 and 3 are currently under the NRC’s normal level of oversight. In 2015, the agency devoted approximately 9,075 hours of review at Millstone.

“Our Annual Assessments allow us to step back at regular intervals and size up plant performance. However, we view oversight of each facility as an ongoing responsibility,” NRC Region I Administrator Dan Dorman said. “In the case of Millstone, the plant’s current performance qualifies for our normal level of oversight.”

The NRC issues reports on performance at each plant twice a year: during the mid-cycle, or mid-point, of the year, and at the conclusion of the year. Inspection findings and performance indicators are also updated on a quarterly basis on the agency's website. Following the release of the Annual Assessment letters each March, the NRC meets with the public in the vicinity of each plant to discuss the results. Normal inspections are carried out by the three Resident Inspectors assigned to Millstone. Reviews are also performed at the sites by specialist inspectors assigned to the agency's Region I Office in King of Prussia, Pa.

Among the areas to be inspected this year at Millstone are radiological safety, emergency preparedness, fire protection and permanent plant modifications. In addition, the NRC will perform an audit at the plant in July to review the company's responses to two of the agency's post-Fukushima orders.

The [Annual Assessment letter](#) for Millstone, as well as the [meeting notice](#) for the March 29th meeting, are available on the NRC website. Current performance information is also available for [Millstone Unit 2](#) and [Millstone Unit 3](#).
